## 1 Summary

This document gives a gallery of tables which can be made by using the **xtable** package to create L<sup>A</sup>T<sub>E</sub>X output. It doubles as a regression check for the package.

```
> library(xtable)
```

> ## Demonstrate data.frame
> tli.table <- xtable(tli[1:10,])
> digits(tli.table)[c(2,6)] <- 0

> print(tli.table, floating=FALSE)

> colnames(insane)[2] <- paste(insane[,2],collapse="")
> print( xtable(insane))
```

Sometimes you might want to have your own sanitization function

```
> wanttex <- xtable(data.frame( label=paste("Value_is $10^{-",1:3,"}$$",sep="")))
> print(wanttex,sanitize.text.function=function(str)gsub("_","\\_",str,fixed=TRUE))

12	Right brace	}

	label

2	Value_is $10^{-2}$
3	Value_is $10^{-3}$

### 3.1 Markup in tables

Markup can be kept in tables, including column and row names, by using a custom `sanitize.text.function`:

```
> mat <- round(matrix(c(0.9, 0.89, 200, 0.045, 2.0), c(1, 5)), 4)
> rownames(mat) <- "$y_{t-1}$"
> colnames(mat) <- c("$R^2$", "$\\bar{R}^2$", "F-stat", "S.E.E", "DW")
> mat <- xtable(mat)

> print(mat, sanitize.text.function = function(x){x})
```

	$R^2$	$\bar{R}^2$	F-stat	S.E.E	DW
$y_{t-1}$	0.90	0.89	200.00	0.04	2.00

You can also have `sanitize` functions that are specific to column or row names. In the table below, the row name is not sanitized but column names and table elements are:

```
> money <- matrix(c("$1,000", "$900", "$100"), ncol=3, dimnames=list("$\\alpha$", c("Income (US$)", "Savings (US$)", "Debt (US$)")))
> print(xtable(money), sanitize.rownames.function=function(x) {x})
```

## 4 Format examples

## 4.4 Suppress row names

```
> print((tli.table),include.rownames=FALSE,floating=FALSE)
```

grade	sex	disadv	ethnicity	timth
6	M	YES	HISPANIC	43
7	M	NO	BLACK	88

If you want a vertical line on the left, you need to change the align attribute.

```
> align(tli.table) <- "|r/r|lp{3cm}l|r/"
```

```
> print((tli.table),include.rownames=FALSE,floating=FALSE)
```

grade	sex	disadv	ethnicity	timth

Revert the alignment to what it was before.

```
> align(tli.table) <- "|rr|lp{3cm}l|r/"
```

## 4.5 Suppress column names

```
> print((tli.table),include.colnames=FALSE,floating=FALSE)
```

Note the doubled header lines which can be suppressed with, eg,

```
> print(tli.table,include.colnames=FALSE,floating=FALSE,hline.after=c(0,nrow(tli.table)))
```

1	6	M	YES	HISPANIC	43

#### 4.6 Suppress row and column names

#### 4.7 Rotate row and column names

The `rotate.rownames` and `rotate.colnames` arguments can be used to rotate the row and/or column names.

```
> print((tli.table),rotate.rownames=TRUE,rotate.colnames=TRUE)
```

	grade	sex	disadv	ethnicity	timth

10	7	M	YES	HISPANIC	87

## 4.8 Horizontal lines

### 4.8.1 Line locations

Use the `hline.after` argument to specify the position of the horizontal lines.

```
> print(xtable(anova(glm.D93)), hline.after=c(1), floating=FALSE)
```

	Df	Deviance	Resid. Df	Resid. Dev
NULL			8	10.58
outcome	2	5.45	6	5.13
treatment	2	0.00	4	5.13

### 4.8.2 Line styles

The  $\text{\LaTeX}$  package `booktabs` can be used to specify different line style tags for top, middle, and bottom lines. Specifying `booktabs = TRUE` will lead to separate tags being generated for the three line types.

Insert `\usepackage{booktabs}` in your  $\text{\LaTeX}$  preamble and define the `toprule`, `midrule`, and `bottomrule` tags to specify the line styles.

```
> print(tli.table , booktabs=TRUE)
```

## 4.9 Table-level $\text{\LaTeX}$

```
> print(xtable(anova(glm.D93)), size="small", floating=FALSE)
```

	Df	Deviance	Resid. Df	Resid. Dev

#### 4.10 Long tables

Remember to insert `\usepackage{longtable}` in your  $\text{\LaTeX}$  preamble.

```
> ## Demonstration of longtable support.
> x <- matrix(rnorm(1000), ncol = 10)
> x.big <- xtable(x, label='tabbig',
+               caption='Example of longtable spanning several pages')
> print(x.big, tabular.environment='longtable', floating=FALSE)
```

## 4.11 Sideways tables

Remember to insert `\usepackage{rotating}` in your LaTeX preamble. Sideways tables can't be forced in place with the 'H' specifier, but you can use the `\clearpage` command to get them fairly nearby.

```
> x <- x[1:30,]
> x.small <- xtable(x,label='tabsmall',caption='A sideways table')
> print(x.small,floating.environment='sidewaystable')
```

## 4.12 Rescaled tables

Specify a `scalebox` value to rescale the table.

```
> x <- x[1:20,]
> x.rescale <- xtable(x,label='tabrescaled',caption='A rescaled table')
> print(x.rescale, scalebox=0.7)
```

## 4.13 Table Width

The `tabularx` tabular environment provides more alignment options, and has a `width` argument to specify the table width.

Remember to insert `\usepackage{tabularx}` in your  $\text{\LaTeX}$  preamble.

```
> df.width <- data.frame(
+   "label 1 with much more text than is needed" = c("item 1", "A"),
+   "label 2 is also very long" = c("item 2", "B"),
+   "label 3" = c("item 3", "C"),
+   "label 4" = c("item 4 but again with too much text", "D"),
+   check.names = FALSE)
> x.width <- xtable(df.width,
+   caption="Using the 'tabularx' environment")
> align(x.width) <- "|l|X|X|l|X|"

> print(x.width, tabular.environment="tabularx",
+   width="\textwidth")
```

	label 1 with much more text than is needed	label 2 is also very long	label 3	label 4
1	item 1	item 2	item 3	item 4 but again with too much text
2	A	B	C	D

## 5 Suppressing Printing

By default the `print` method will print the LaTeX or HTML to standard output and also return the character strings invisibly. The printing to standard output can be suppressed by specifying `print.results = FALSE`.

```
> x.out <- print(tli.table, print.results = FALSE)
```

Formatted output can also be captured without printing with the `toLatex` method. This function returns an object of class "Latex".

```
> x.ltx <- toLatex(tli.table)
> class(x.ltx)
```

```
[1] "Latex"
```

```
> x.ltx
```
