## 2010 Q1 link clearance: Microsoft blogger edition

devblogs.microsoft.com/oldnewthing/20100331-01

March 31, 2010

Raymond Chen

It's that time again: Sending some link love to my colleagues.

- <u>Names and file system filters</u>. Even if you aren't interested in file system filters (and you probably aren't), the discussion of names is very interesting, particularly in light of <u>the</u> <u>confusion over hard links</u> and the difference between a file and its names.
- Mark Russinovich creates 16 million handles in a single process. Famous last words: "16 million handles should be enough for anybody." And learn that a handle isn't really an index into an array. (If handles were kept in an array, then the kernel would find itself having to reallocate a a 16-million-element array.)
- <u>Larry Osterman</u> digs into the etymology of the Microspeak term <u>giblet</u>.
- <u>Joey deVilla</u> points out a little-known Bing search operator <u>which shows all domains</u> <u>registered at a particular IP address</u>.
- <u>Shawn Steele</u> explains <u>pseudo-locales</u>, which look an awful lot like <u>l33t</u>. <u>Michael Kaplan</u> begs you <u>not to call it ps-ps</u>.
- <u>Michael Kaplan</u> sarcastically observes that Notepad is <u>the apparent premiere tool of UNIX shell script authors throughout the world</u>. (I wish I could get away with being as snarky as Michael.)
- DPI emulation normally kicks in when the logical DPI is set above 120. <u>Kam VedBrat</u> explains how you can <u>enable DPI emulation at lower DPI levels</u>.
- The <u>ESL Assistant team blog</u> introduces, well, the <u>ESL Assistant</u>, a Web page to assist non-native speakers of English with their writing. "Introduce" is a misnomer here, since the ESL Assistant has been around since 2008. Too bad nobody knows about it.
- <u>Eric Lawrence's IEInternals</u> discusses <u>The User Agent String: Use and Abuse</u>. Eric's blog is full of good in-depth stuff like this, like <u>Understanding Domain Names in Internet Explorer</u>, which discusses the difficulty of trying to figure out where the important part of the domain name is.
- <u>The Larry Osterman trifecta is now in play</u>. This time, he shares <u>his own take</u> on <u>the cost of updating *everything*</u>.
- <u>Tina Wood</u> gives a glimpse behind the curtain of <u>Life at Microsoft: The truth revealed</u>. There's also <u>a second episode</u>.

- Adrian Marinescu <u>discusses the heap manager</u>. Silviu Calinoiu <u>discusses the fault-tolerant heap</u>. Richard Johnson <u>presents [ppt]</u> some implementation details of the low fragmentation heap (from a security perspective).
- What happens when the network goes down. (Related to What happens when the power goes out.)
- Janne Mattila repurposes Internet Explorer 8's InPrivate Filtering as an ad-blocker.
- <u>Eric Lippert</u> has <u>his own exercise in psychic debugging</u>. (<u>Answer</u>.) Understanding this puzzle means that you don't need to have <u>this subtlety of the Zip sequence operator</u> explained to you.
- How to enable the light sensor on your laptop and what it gets you.
- The <u>NTdebugging blog</u> has examples of all sorts of debugging techniques. It has a kernel-mode focus, but <u>there's user-mode stuff mixed in there occasionally.</u>
- <u>Alan Page</u> builds on <u>Eric Sink's article Why we all sell code with bugs</u> (<u>long version</u>) with his own explanation of <u>why bugs don't get fixed</u>.
- I asked <u>Rico Mariani</u> to share his story about the clever way he addressed unmanaged heap fragmentation back in the late 1990's. Turns out <u>he did it years ago and I missed it</u>.
- <u>Shawn Hargreaves</u> tells a story about <u>a bug whose effect was so awesome it became a</u> feature.
- Over on the <u>fontblog</u>, Kevin Larson <u>debunks an Internet myth about ltteer scrmbaling</u>.
- On the <u>Windows Installer Team Blog</u>, Hemchander discusses <u>Windows Installer and the Restart Manager</u>, and way at the bottom is information on how you can make your program survive an update-triggered reboot.
- <u>Keith Combs</u> points us to the surprising <u>showdown between a shark and an octopus</u>. (<u>Older grainier video</u>.) Was this the inspiration for <u>Mega Shark vs. Giant Octopus</u>? (Oh, and the octopus had help.)
- <u>Brandon Paddock</u> demystifies <u>The so-called "God Mode"</u>: It's just part of the plumbing that drives the Start menu and Control Panel search functions. We saw something like this before, when people took the *Copy To* and *Move To* toolbar buttons and <u>turned them into context menu items</u>. In both cases, you're using something in a manner it was not designed for or tested for, so if it doesn't work, well, nobody promised that it would.
- Roberto Alexis Farah shows us another cool debugger command: !findstack.
- <u>danah boyd</u> posted <u>the speaker notes for her SXSW keynote Making Sense of Privacy and Publicity</u>. She gave <u>a longer version of the same talk to Microsoft employees</u> two weeks earlier.
- Larry Osterman explains what's up with the Beep driver.
