What's the difference between LastWriteTime and ChangeTime in FILE_BASIC_INFO?

The `FILE_BASIC_INFO` structure contains a number of fields which record the last time a particular action occurred. Two of the fields seem to describe the same thing.

> **LastWriteTime**
> The time the file was last written to.
> **ChangeTime**
> The time the file was changed.

What's the difference between writing to a file and changing it? I'm told that the difference is metadata. The LastWriteTime covers writes to the file's data stream (which you accomplish via the `WriteFile` function). On the other hand, the ChangeTime also includes changes to the file metadata, such as changing its file attributes (hidden, read-only, *etc*.) or renaming the file.

(And don't forget that LastAccessTime updates are off by default now.)
