2010 Q3 link clearance: Microsoft blogger edition

September 30, 2010

Raymond Chen

It's that time again: Sending some link love to my colleagues.

- <u>Jim O'Neil</u> shows <u>how to plug OpenSearch search into Explorer and customize it a bit</u>. <u>Scott Hanselman</u> provides <u>a few to get you started</u>. Other resourceful folks have cooked up <u>still more</u>. (Oh, and <u>if you want "Search the Internet" to be available from your Start menu</u>, you can turn on *Add Search Internet link to Start Menu* in the Group Policy Editor under User Configuration, Administrative Templates, Start Menu and Taskbar.)
- Eric Lawrence takes time out from his <u>day blog</u> to post on the <u>Fiddler blog</u>.
- <u>Andy Pennell</u> gives some backstory on <u>the secrecy behind the KIN phone</u> <u>announcement</u>. (I have a few KIN promotional items which I plan to use as a contest giveaway. First I need a contest idea...)
- <u>Murray Sargent</u> digs into the Unicode Bidi Algorithm, specifically <u>where it tends to fall</u> down.
- <u>Gus Class</u> explains <u>how to report bugs in SDK documentation</u>.
- <u>Paul Betts</u> investigates <u>the case of the disappearing OnLoad exception</u>.
- The <u>Group Policy Search</u> tool on MSDN lets you browse or search a database of group policies. You can even install an Internet Explorer search provider or a Windows 7 Search Connector so you can search for group policies directly from Internet Explorer or Explorer.
- <u>Chris Jackson</u> answers the question <u>What is the deal with shimming on Windows Vista 64-bit</u>? He also explains that <u>you can't fix application compatibility problems with dialog boxes</u>. (Chris also <u>covers an application compatibility bug that technically isn't a compatibility bug at all</u> because the problem occurred even on Windows XP. The application was <u>mixing colors that weren't meant to be mixed</u>.)
- <u>Volker Will</u> points out that <u>support for 32-bit applications is an optional component in Windows Server 2008 R2 Server Core</u>. (Man, what a long product name.)
- <u>Eric Ligman</u> discovers that <u>the use of acronyms is way out of control</u>.
- The <u>WER Services blog</u> explains <u>what the three answers to "Help protect your computer and improve Windows automatically" actually mean.</u>

- <u>Chris Pendleton</u> noted some <u>special map mash-ups from the City of Seattle</u>: <u>The Travelers Information Map</u> and <u>My Neighborhood Map</u>. (In the time since that entry was written, Chris has <u>taken up posting to the Bing Maps blog</u>.)
- <u>Larry Osterman</u> tells another story of <u>Last Checkin Chicken</u>.
