

Why doesn't SHGetKnownFolderPath return the customized path?

Raymond Chen

A customer reported that the `SHGetKnownFolderPath` function was not working correctly. They moved their Videos folder to a new location, but when they called `SHGetKnownFolderPath`, they got the old path rather than the new one.

A quick check of the code they provided showed why:

```
...
SHGetKnownFolderPath(FOLDERID_Videos,
                    KF_FLAG_DONT_VERIFY |
                    KF_FLAG_DEFAULT_PATH,
                    NULL,
                    &pszPath);
```

Um, you're passing the `KF_FLAG_DEFAULT_PATH` flag. That flag means "Tell me where this folder *would have been* if its location had never been customized." Therefore, if you pass this flag, you have no right to complain that it's returning a path different from the customized path. Because passing that flag means "I don't want the customized path."
