

Is there a way to disable a specific balloon notification without disabling all of them?

Raymond Chen

There is a group policy called *Turn off all balloon notifications*, but what if you want to turn off only one specific notification? The taskbar does not offer fine-grained policy control over balloon notifications. All you have is the giant sledgehammer that turns off all of them. If there is a specific balloon you want to disable, you have to check with the specific program that is raising them, or the specific product feature, to see if it offers a way to turn the balloon off.

For example, there is a setting to [disable the low disk space checks](#) and another one to [disable notifications that tell you when you have lost the connection to a networked file and are working on the local copy](#).
