

Stupid cmd.exe tricks: Changing directories with forward slashes instead of backslashes

I observed one of my colleagues perform this trick with `cmd.exe`: You can pass a path with forward slashes (instead of backslashes) to the `cd` command, provided the first character is not a slash.

```
cd relative/path      &rem okay
cd ../relative/path  &rem okay
cd /absolute/path    &rem not okay
cd c:/absolute/path  &rem okay
```

It's not much of a trick, but it comes handy once in a while.
