From March 2016 we've observed the evolution of an interesting low-level ransomware, Petya – you can read about it <u>here</u>. The <u>second version (green) Petya</u> comes combined with another ransomware, packed in the same dropper – <u>Mischa</u>. The latter one was deployed as an alternative payload: in case if the dropper was run without administrator privileges and the low-level attack was impossible. This combo is slowly reaching its maturity – the authors fixed bugs that allowed for decryption of the two earliest versions. Now, we are facing an outbreak of the fourth version – this time under a new name – Goldeneye, and, appropriately, a new, golden theme.

In this post we will take a look inside, in order to answer the question of whether or not any internal changes followed the external alterations.

# Analyzed sample

#### 435076f9c8900cbdfc48a15713b1c431 – Goldeneye Decrypter (original)

// special thanks to <u>@procrash</u>

# Distribution

Currently Goldeneye is distributed by phishing e-mails, in campaigns targeting Germany. The same pattern of distribution was observed in first editions of Petya ransomware. Germany seems to be an environment familiar to this <u>ransomware</u> author (who is probably a German native speaker) and his testing campaigns are always released in this country. However, the threat will probably go global again, as the affiliate program for other criminals is going to be released soon.

# Behavioural analysis

After being run, the malware installs its copy in the %APPDATA% directory, under the name of a random application found in the system:

AppData      Roaming      {ec080e30-3992-4d5c-8491-2c7167652c92}											
n library 🔻 Share with 👻 New folder											
Name	Date modified	Туре	Size								
🗾 ksetup.exe	2016-12-08 00:26	Application	256 KB								

The installed copy is automatically executed and proceeds with malicious actions.

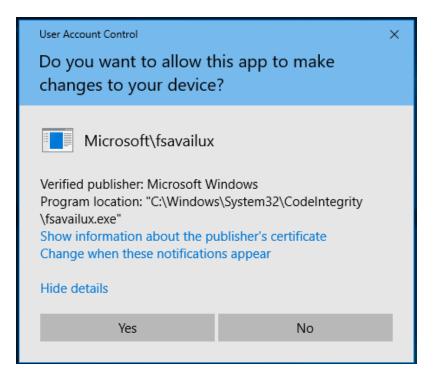

In the past, the dropper of Petya/Mischa used to trigger a UAC popup window. If the user had agreed to run the sample as the Administrator, he/she was attacked by the low-level payload: Petya. Otherwise, the high-level Mischa was deployed.

In the current case the model of the attack is different and looks more like a case of <u>Satana</u> <u>ransomware</u>.

First, the high-level attack is deployed and the files are encrypted one by one. Then, the malware tries to bypass UAC and elevate its privileges by its own, in order to make the second attack, this time at low-level: installing Petya at the beginning of the disk. The bypass works silently if the UAC is set to default or lower. In cases where the UAC is set to max, the following window pops up repeatedly, till the user accepts the elevation:

😌 User Account	Control 💌											
Do you want to allow the following program to make changes to this computer?												
	Program name:       File Operation         Verified publisher:       Microsoft Windows         CLSID:       {3AD05575-8857-4850-9277-11B85BDB8E09}         Show information about this publisher's certificate											
Hide details	Yes No											
	Change when these notifications appear											

The used bypass techniques works on both – 32-bit and 64-bit – versions of Windows, up to Windows 8.1. On Windows 10, even if the UAC is set to default a popup is displayed – but not revealing the real name of the infecting program, i.e.

## The high-level part (former Mischa)

On the first stage of the attack, files are being encrypted one by one. The malware drops the following note in TXT format:

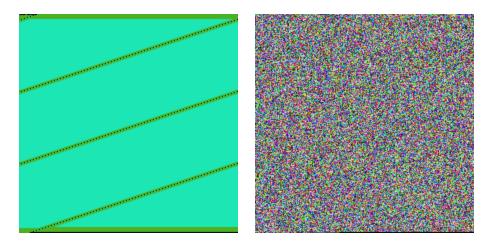

YOUR_FILES_ARE_ENCRYPTED.TXT - Notepad									
File Edit Format View Help									
You became victim of the GOLDENEYE RANSOMWARE!									
The files on your computer have been encrypted with an military grade encryption algorithm. There is no way to restore your data without a special key. You can purchase this key on the darknet page shown in step 2.									
To purchase your key and restore your data, please follow these three easy steps:									
<ol> <li>Download the Tor Browser at "https://www.torproject.org/". If you need help, please google for "access onion page".</li> </ol>									
2. Visit one of the following pages with the Tor Browser:									
http://golden5a4eqranh7.onion/уС5pDbHp http://goldeny4vs3nyoht.onion/уС5pDbHp									
3. Enter your personal decryption code there:									
yC5pDbHpaoUMuR4Vk6Q4CV4Rjjvqg9vQ7hRp6zVwPeeopoNyWVwDof2MqEx2Q39jy9o2mqy5cf89xG55TgXEbC6Ne5noVfvw									

Files that are encrypted are added random extensions:

Name	Date	Туре	Size
dump.bin.yC5pDbHp	2016-12-07 18:06	YC5PDBHP File	3 KB
main.cpp.yC5pDbHp	2016-12-07 18:05	YC5PDBHP File	4 KB
square1 (another copy).bmp.yC5pDbHp	2016-05-26 23:58	YC5PDBHP File	141 KB
square1 (copy).bmp.yC5pDbHp	2016-05-26 23:58	YC5PDBHP File	141 KB
square1.bmp.yC5pDbHp	2016-05-26 23:58	YC5PDBHP File	141 KB
wrapper.h.yC5pDbHp	2016-12-07 18:05	YC5PDBHP File	2 KB

If we have two files with the same plaintext they turn into two different cipher-texts – that indicates that each file is encrypted with a new key or an initialization vector. The high entropy suggests AES in CBC mode.

Visualization – original file vs encrypted one:

## The low-level part (former Petya)

The second stage of infection is deployed after encrypting the files. The behavior of second payload is no different than in the previous versions of Petya. After the malware is deployed, system crashes and starts with a fake CHKDSK. It pretends to be checking the disk for

errors, but in reality it performs Master File Table encryption, using Salsa20. After it is completed, we are facing a familiar blinking skull – this time in yellow/golden color:

After pressing a key, we can see the screen with the ransom note:

#### You became victim of the GOLDENEYE RANSOMWARE!

The harddisks of your computer have been encrypted with an military grade encryption algorithm. There is no way to restore your data without a special key. You can purchase this key on the darknet page shown in step 2.

To purchase your key and restore your data, please follow these three easy steps:

 Download the Tor Browser at "https://www.torproject.org/". If you need help, please google for "access onion page".
 Units and all the Tor Provide the Tory Provide the

2. Visit one of the following pages with the Tor Browser:

http://goldenhjnqvc2lld.onion/ngWPic5x http://golden2uqpiqcs6j.onion/ngWPic5x

3. Enter your personal decryption code there:

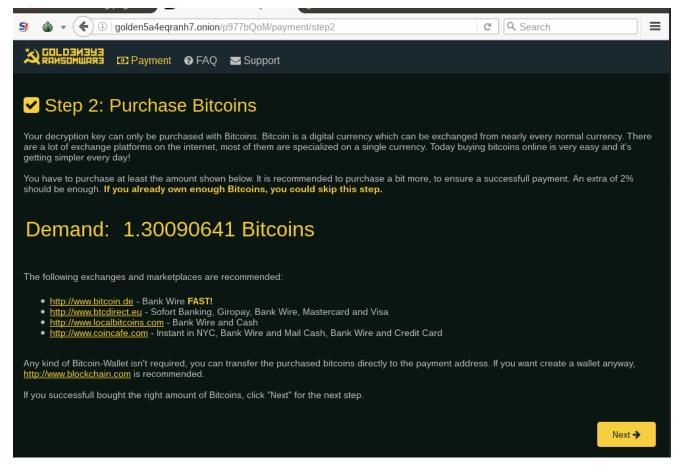

ngWPic-5xHNJB-JPo2ap-H7gDqS-6oMbCV-PCAEbX-SAC6ju-3jF3oe-EiDXB3-8huJBgcYDbGH-9izqGC-f28NPM-1pGa5R-DqZZH5-eKA9eh

If you already purchased your key, please enter it below.

Key:

Page for the victim

On every edition all the pieces of the ransomware had a consistent theme. This time is no different. The page for the victim, that is hosted on a Tor-based site comes in very similar theme like the ransomware itself:

After paying the ransom, the victim is provided with a key to decrypt the first (bootlocker) stage and a decrypter to recover the files:

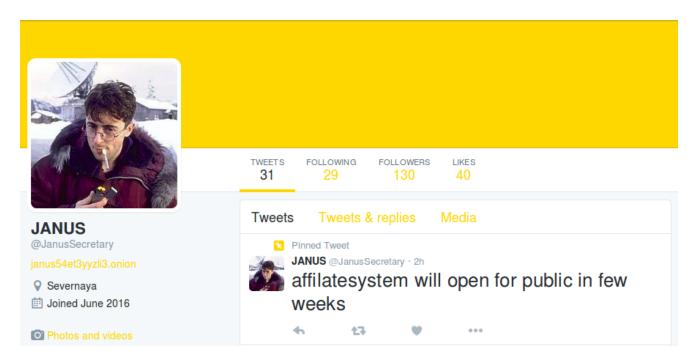

GOLDENEYE Decrypter	- • •
Step 1: Find encrypted files First you have to find the encrypted files on your computer. You can either let search for encrypted files automatically, or select files manually.	this program
Search encrypted files	
If you know the extension of the encrypted files, you can enter it below and search process.	speed up the
File extension (optional): e.g.: XXXXXXXX	Search
Select encrypted files	
Please select or drag file you want to decrypt.	
	Next

The decrypter requires having a proper key in order to work:

GOLDENEYE De	crypter	- • ×
-	enter your purchased password. WARNING: Please check yo with a wrong password, you could destroy your files! Please	
Password:		
Repeat password:		
	Backup encrypted files (recommended)	
		Decrypt

# Affiliate program

In the past, Petya/Mischa combo was available as RaaS (Ransomware as a Service). Following the changes in the layout, the Twitter account associated with the criminal(s) behind the malware, also changed the theme of the profile, and updated the information about the affiliate program status:

It confirms that the actor behind Goldeneye as well as the methods of redistributing it didn't change.

# Inside

This ransomware is very complex, having multiple pieces that have already been described in our previous articles. That's why, in this one we will focus only on the differences comparing to the previous editions. Let's start from the *core.dll*, that is the PE file that we get after unpacking the first layer.

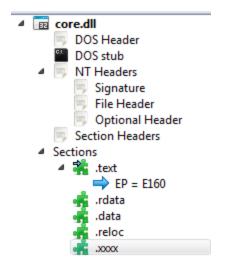

## The core.dll

Just like in the previous versions, the main application is a DLL (*core.dll*), packed by various crypters and loaded by a technique known as *Reflective Loader*.

Offset	Name	Value	e Me	eaning					
EB90	Characteristics	0							
EB94	TimeDateStamp	5845/	AF3A						
EB98	MajorVersion	0							
EB9A	MinorVersion	0							
EB9C	Name	F7C2	co	re.dll					
EBA0	Base	1							
EBA4	NumberOfFunctions	1							
EBA8	NumberOfNames	1	1						
EBAC	AddressOfFunctions	F7B8							
EBB0	AddressOfNames	F7BC							
EBB4	AddressOfNameOrd	inals F7C0							
Details									
Offset	Ordinal F	unction RVA	Name RVA	Name					
EBB8	1 C	B95	F7CB	ReflectiveLoader@4					

In the past Petya and Mischa were two separate modules delivered by this DLL. The dropper was deciding which one of them to deploy, by making an attempt to run the sample with Administrator privileges – no UAC bypass was used, only social engineering. Now, however, it comes with two DLLs that perform UAC bypass – one for 32 bit and another for 64 bit variant of Windows. It decides which one to deploy, basing on the detected architecture.

The internal logic of this module changed a bit. There is no *Mischa.dll* separated. Instead, the *core.dll* covers the functionality of encrypting files as well as of installing disk locker afterwards. The payloads are XOR encrypted and stored in the last section of the PE file (*.xxxx*):

Section .xxxx contains:

- the low level part (former Petya)
- 32 bit DLL (elevate\_x86.dll)
- 64 bit DLL (elevate\_x64.dll)

(The two DLLs used to UAC bypass are based on the technique similar to the one described <u>here</u>.)

At first run, the core module makes its own copy into %APPDATA% and applies some tricks to blend into the environment:

- Choosing the application name at random, out of various applications in System folder
- Changing own timestamp to the timestamp of Kernel32.dll (the so called "timestomping" technique).

Adding to its resources the resource of the genuine Microsoft application, under which name it is installed:

Result:

R	Roaming > {498fe69f-e96e-4f5b-ae7e-80e04257933f}											
vitl	n ▼ New folder											
	Name		Date modified	Туре	Size							
	efsui.exe		2016-12-14 20:06	Application	86 KB							
ſ	🕅 Resource Hacker - efsui.exe											
	File Edit View Action Help					Version Info: 1:0						
		$\mathbf{i}$	- D C	94	Dialog Mert	1						
	✓ Wersion Info	3 4 5 6 7	VALUE VALUE VALUE VALUE VALUE VALUE VALUE	2600,16385 B0" "CompanyName", "FileDescription", "FileVersion", "6. "InternalName", "LegalCopyright", "OriginalFilename" "ProductName",	"efsui" , "© Microsoft Corpo ", "efsui.exe"							

Some of those tricks remind us of <u>Cerber ransomware</u> and they were probably inspired by it.

Then, the dropper deploys the installed copy and proceeds with encryption.

#### The file cryptor (former Mischa)

The file cryptor feature is now implemented inside the *core.dll*.

It behaves similarly to the former Mischa ransomware – the only difference is that now it is employed before the low-level attack, rather than being an alternative.

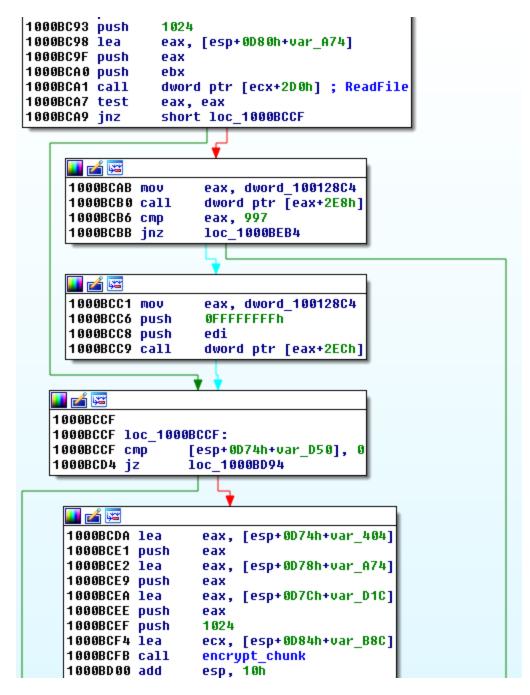

Attacked targets

Files are attacked with the following extensions:

doc docx docm odt ods odp odf odc odm odb xlsm xlsb xlk xls xlsx pps ppt pptm pptx pub epub pdf jpg jpegB rtf txt frm wdb ldf myi vmx xml xsl wps cmf vbs accdb cdr svg conf cfg config wb2 msg azw azw1 azw3 azw4 lit apnx mobi p12 p7b p7c pfx pem cer key der mdb htm html class java cs asp aspx cgi h cpp php jsp bak dat pst eml xps sqllite sql js jar py wpd crt csv prf cnf indd number pagesN po dcu pas dfm directory pbk yml dtd rll cert p12 cat inf mui props idl result localstorage ost default json db sqlite bat x3f srw pef raf orf nrw nef mrw mef kdc dcr crw eip fff iig k25 crwl bay sr2 ari srf arw cr2 raw rwl rw2 r3d 3fr ai eps pdd dng dxf dwg psd ps png jpe bmp gif tiff gfx jge tga jfif emf 3dm 3ds max obj a2c ddspspimage yuv 3g2 3gp asf asx mpg mpeg avi mov flv wma wmv ogg swf\$ ptx ape aif wav ram ra m3u movie mp1 mp2 mp3 mp4 mp4v mpa mpe mpv2 rpf vlc m4a aac aa aa3 amr mkv dvd mts qt vob 3ga ts m4v rm srt aepx camproj dash zip rar gzip vmdk mdf iso bin cue dbf erf dmg toast vcd ccd disc nrg nri cdi

#### Encryption

Files are read in chunks, each is 1024 bytes long. Then, they are processed by the built-in implementation of AES.

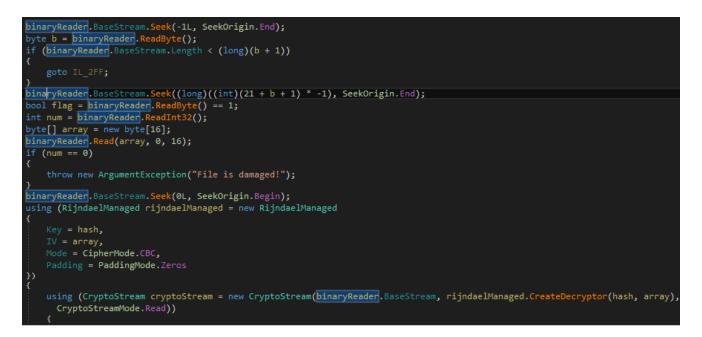

The easiest way to analyze the encryption algorithm used, is by reversing the original decrypter, provided by the ransomware author to victims that paid the ransom. The decrypter is written in .NET and not obfuscated.

Looking at the decrypter code we can confirm that each file is encrypted using AES in CBC mode. The AES key is 32 byte long, and it is the taken from the beginning of SHA512 hash of the password.

this.DecryptPassword1.Text = this.DecryptPassword1.Text.Replace("-", "").Replace(" ", ""); this.DecryptPassword2.Text = this.DecryptPassword1.Text; byte[] hash = new SHA512Managed().ComputeHash(Step2.StringToByteArray(this.DecryptPassword1.Text)).Take(32).ToArray<byte>();

The initialisation vector is random for every file and it is stored in its content:

## The disk locker (former Petya)

This part of the Goldeneye ransomware is written at the disk beginning and is independent from the operating system. It is made up of a bootloader and a tiny, 16-bit kernel. At the very first sight we can suspect, that it is nothing more than a refactored Petya. That's why, for the simplicity I will refer this part as Petya Goldeneye.

Indeed, comparing the current edition with Petya 3 (described <u>here</u>) we can see, that the encryption algorithm and the codebase hasn't changed. Yet, we can spot some differences.

#### Encryption

All versions of Petya use Salsa20 to encrypt MFT. In the current edition, the implementation of Salsa20 is identical like in the <u>former version</u>.

similarity	confidence	change	EA primary	name primary	EA secondary	name secondary
1.00	0.98		00009462	rotl	000096C4	sub_96C4_70
1.00	0.88		00009578	s20_columnround	000097DA	sub_97DA_73
1.00	0.99		00009798	s20_crypt	000099FA	sub_99FA_79
1.00	0.99		000095D8	s20_doubleround	0000983A	sub_983A_74
1.00	0.99		000096D4	s20_expand32	00009936	sub_9936_78
1.00	0.99		00009652	s20_hash	000098B4	sub_98B4_77
1.00	0.99		000095EC	s20_littleendian	0000984E	sub_984E_75
1.00	0.99		0000949A	s20_quarterround	000096FC	sub_96FC_71
1.00	0.98		00009628	s20_rev_littleendian	0000988A	sub_988A_76
1.00	0.88		00009518	s20_rowround	0000977A	sub_977A_72

See the *BinDiff* screenshot below – Petya Goldeneye vs Petya 3:

We can safely assume, that just like in the previous case the Salsa20 has been implemented correctly – means, this edition of Petya is not decryptable by external tools.

What has changed in the code?

Although the main parts of the code didn't change, still we can notice that some refactoring has taken place:

0.99	0.99	-I	00008C98		00008E52	sub_8E52_61
0.99	0.99	-I	0000811A	fake_chkdsk	0000811A	sub_811A_34
0.93	0.98	GI	00008DE2	deploy_salsa	00008FA0	sub_8FA0_62
0.93	0.98	GI	00008FA6	mft_salsa_crypt	00009146	sub_9146_63
0.72	0.98	GIL-	00009386	xor_crypt	0000951E	sub_951E_64
0.69	0.95	-IE	0000891E	reboot_disk	00008ADA	sub_8ADA_47
0.27	0.65	GIELC	00008220	decrypt	00008228	sub_8228_36

The most important changes are about the way in which the encryption/decryption is applied. The author added more checks and simplified the decryption function. Yet, the changes are rather about improving the code quality rather than introducing some new ideas.

Layout

Just like in the previous cases, Petya's code is written at the beginning of the disk – however, now the layout is more compact. The code of Petya's kernel starts just after MBR, without any padding. Due to this, other important sectors are also shifted. For example, the data sector, where the random salsa key is saved\*, is now placed in sector 32:

00003FF0	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	
00004000	00	65	65	89	D1	CC	56	41	82	D6	20	74	C2	53	D0	09	.ee%ŃĚVA,Ö tÂSÐ. Sector 32
00004010	76	3B	C9	A3	5E	FE	55	DC	01	9C	A7	19	OF	12	3E	E3	v;ÉŁ^ţUÜ.ś§>ă
00004020	32	8C	E9	F6	EA	8B	29	B8	93	68	74	74	70	ЗA	2F	2F	2Śéöę<),"http://
00004030	67	6F	6C	64	65	6E	68	6A	6E	71	76	63	32	6C	6C	64	goldenhjnqvc211d
00004040	2E	6F	6E	69	6F	6E	2F	72	7A	76	6A	34	33	66	57	00	.onion/rzvj43fW.
00004050	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	00	
00004060	00	00	00	00	00	00	00	00	00	68	74	74	70	ЗA	2F	2F	http://
00004070	67	6F	6C	64	65	6E	32	75	71	70	69	71	63	73	36	6A	golden2uqpiqcs6j
00004080	2E	6F	6E	69	6F	6E	2F	72	7A	76	6A	34	33	66	57	00	.onion/rzvj43fW.
00004000	~~	~~	~~	~ ~	~~	~~	~ ~	~~	~ ~	~ ~	~~	~ ~	~ ~	~~	~ ~	~ ~	

*\* just like in all previous editions, this key is erased after use. Read more about the full procedure <u>here</u>.* 

Summing up, all the sectors are shifted towards the beginning of the disk.

Data sector:

- Petya3: 54
- Petya Goldeneye: 32

Verification sector:

- Petya3: 55
- Petya Goldeneye: 33

Original MBR (xored with 7)

• Petya3: 56

• Petya Goldeneye: 34

# Conclusion

Goldeneye ransomware is yet another step in the development of the Petya/Mischa bundle. The redesigned dropper coupled both elements together in a new way, that makes it even more dangerous. At the current stage the product doesn't seem decryptable by external tools. We strongly advise to be very vigilant about opening e-mail attachments, because this is still the main way of distribution of this ransomware.

During the tests, Malwarebytes has proven to protect against the malicious payloads attached to Goldeneye phishing e-mails:
