MADE WITH PYTHON 

Python network worm that spreads on the local network and gives the attacker control of these machines.

This code is not finished and works more like a "worm template" for you to get inspiration at the moment.

You can bruteforce ssh servers, spread with USBs, etc..

```

Bruteforcing local machines with port 22 open.

Downloading necessary libraries

```
pip install -r requirements.txt
```

Executing

Windows & Linux:

```
python worm.py
```

Compilation (.exe)

Targeted machines won't probably have python and the required libraries installed. To run this code on other machines, you need to convert it into an executable.

I recommend the [Pyinstaller library](#).

To use it, simply write these commands in your terminal:

```
pip install pyinstaller
```

```
pyinstaller worm.py
```
